## About PANEL 2050 project and CEESEN

The PANEL 2050 project has the aim to create durable and replicable sustainable energy networks at local (municipality/community) level, where relevant local stakeholders collaborate for the creation of a local energy visions, strategies and action plans. The aim of these networks is to contribute to and actively work for the transition towards low carbon communities in 2050.

The PANEL 2050 partnership provided support for the creation of first successful local energy networks in the CEE countries. In the course of the project, organisations from 10 CEE countries collaborated on creating regional energy strategies and action plans.

PANEL model is a comprehensive approach for implementing local long-term energy management, supported by the community. PANEL model consists of seven main elements: **Stakeholder Engagement, Training Program, Guidebook, Long-term Energy Visions/Roadmaps/Action Plans and Central and Eastern European Sustainable Energy Network CEESEN.**

## PANEL2050 model for Central and Eastern Europe Sustainable Energy Network CEESEN

These elements were developed by PANEL 2050 project to support the CEE communities on achieving their sustainability goals. After initial implementation, PANEL model could be used by the forerunners in other regions inside and outside of EU.

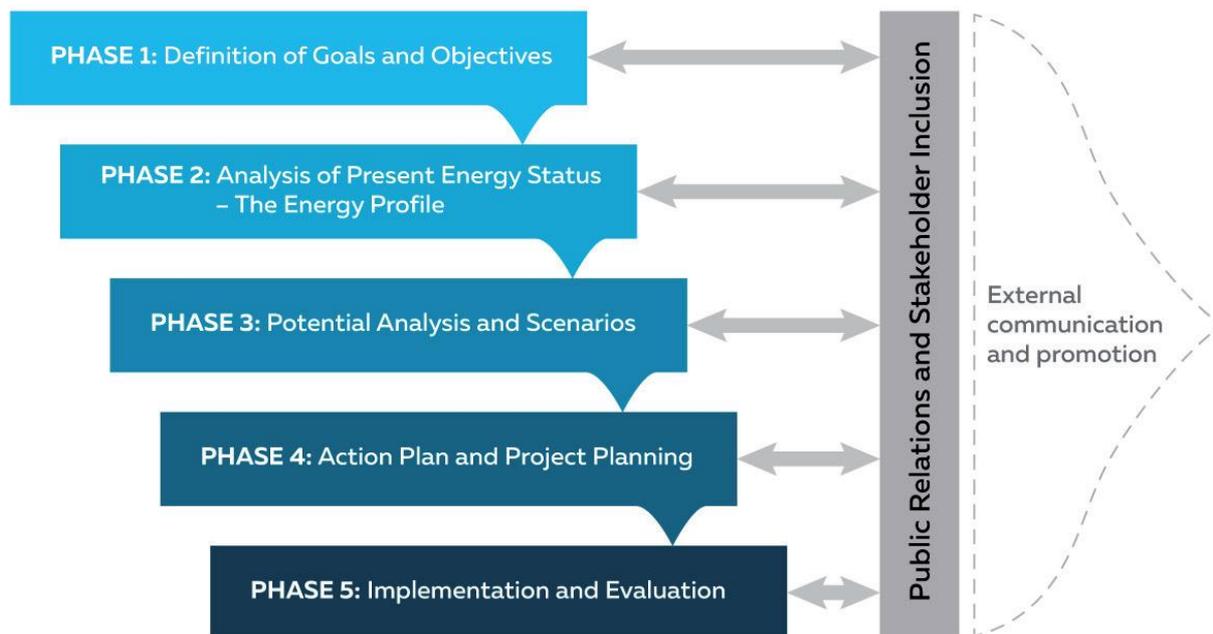

PANEL 2050 project is taking a multidisciplinary approach for combining the political theory with the technical discipline of energy planning. As an outcome, a set of tools - PANEL model - were created for supporting energy transition in local communities. Ten CEE regions implemented PANEL model during the project and developed Roadmaps supporting the local transition to low-carbon economy.

Stakeholder Engagement is taking a strategic approach for engaging the community to the local energy management. Stakeholders were invited to participate in the long-term energy planning, bringing their knowledge and validation into the process. They were supported by engagement experts and capacity building activities.

Energy Advocacy Training Program developed the skills of the stakeholders on active participation in sustainable policy development in their communities. Training Program included the Curriculum in English and the training materials in 10 languages of CEE region. Local trainings were complemented by international Bootcamp for advocacy and networking.

Guidebook on Advocating Sustainable Energy in Central and Eastern Europe compiles the important topics of energy advocacy and complements the training program. Guidebook is available in English and 10 languages of CEE region.

Energy Visions, Roadmaps and Action Plans are the outputs of the long-term energy planning process with the aim of plotting the regional transition towards a low-carbon community. These components of a regional energy strategy were developed with the organized support of stakeholders and forerunners that will take the initiative of implementing the plans in the future.

Forerunners are organized themselves as the members of Central and Eastern European Sustainable Energy Network (CEESEN) using the online platform [ceesen.org](http://ceesen.org), that will remain the basis for the future cooperation. The members of CEESEN can participate in international conferences and training, organized by the network.

For more information and support visit [ceesen.org](http://ceesen.org) or contact us by [info@ceesen.org](mailto:info@ceesen.org).

## Roadmapping in PANEL model

CEESEN is promoting and supporting the transition towards a low-carbon community in Europe by 2050. This broad vision of a low-carbon economy needs to be broken down and connected with activities on local level. This transition needs to be individualised on regional or local level in the countries of Central and Eastern Europe. In order to shape the process CEESEN supported 10 regions in CEE in developing roadmaps for a sustainable energy future.

The overarching vision was to get to a regional low-carbon economy by 2050, as pointed out by EU policy documents and climate agreements.

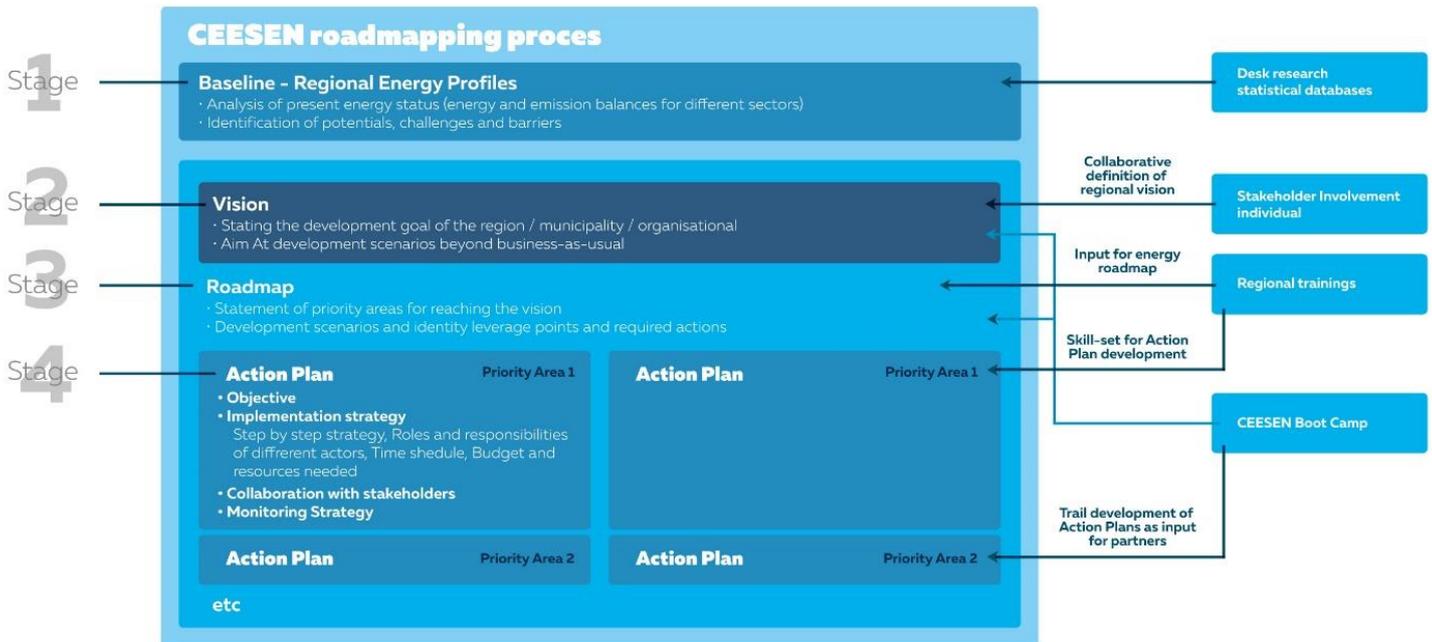

For reaching this vision it is not productive to forecast current trends and behaviour into estimates of the future. Forecasting is a predictive tool but mostly it doesn't provide you with a connection to your vision and delivers no new perspective for points of leverage.

Back casting on the contrary starts from a vision statement and then looks back to assess what would be required to get there. This method leaves space for innovative ideas and radical actions opening up the dialogue what different actors (policy- makers, industry, NGOs, consumers) can or have to contribute. The Roadmap is the guideline describing the pathway towards the vision with stating and planning concrete future actions.

The CEESEN roadmaps on energy future 2050 are designed in comprehensive process encompassing the process of generating a baseline, setting a regional vision, drawing up the roadmap itself including several action plans.

The roadmapping model, which all partners were asked to follow is divided into different steps building on each other from the first initial data collection to a complete implementation plan.

This 4 stages-model helped to structure the process for the roadmapping teams and ensure that the sequence of tasks was followed before proceeded to the next stage.

For these 4 connected stages of the roadmapping process external input is needed either to generate data, encompass differ viewpoints or engage possible implementers and multipliers as well as supporting activities, which were implemented by the project partners.

The model was used by all partners to document the highlights of their roadmap on one page as well as show how stakeholder input was processed, and other project activities contributed to the roadmap documents. For this purpose, WP3 provided an “empty” template of the above infographic to the partners and supported them in visualizing their individual roadmapping process.

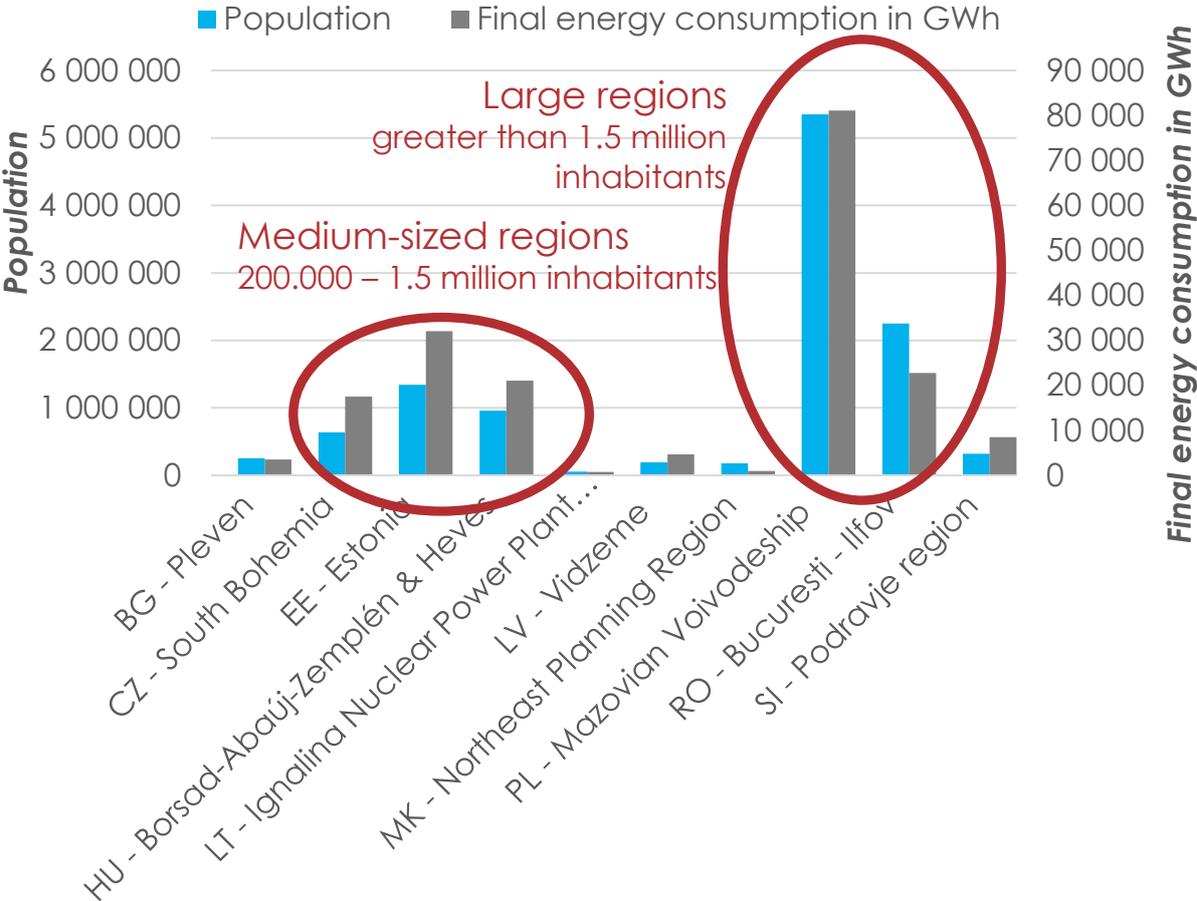

The roadmaps and related documents were made available both in the local language and English. This provided on the one hand a basis for local actors involved in the implementation and on the other hand act as case study of forerunner activities in CEE for international dissemination.

### Regional Energy Profiles - Establishing a baseline for roadmapping (D3.1)

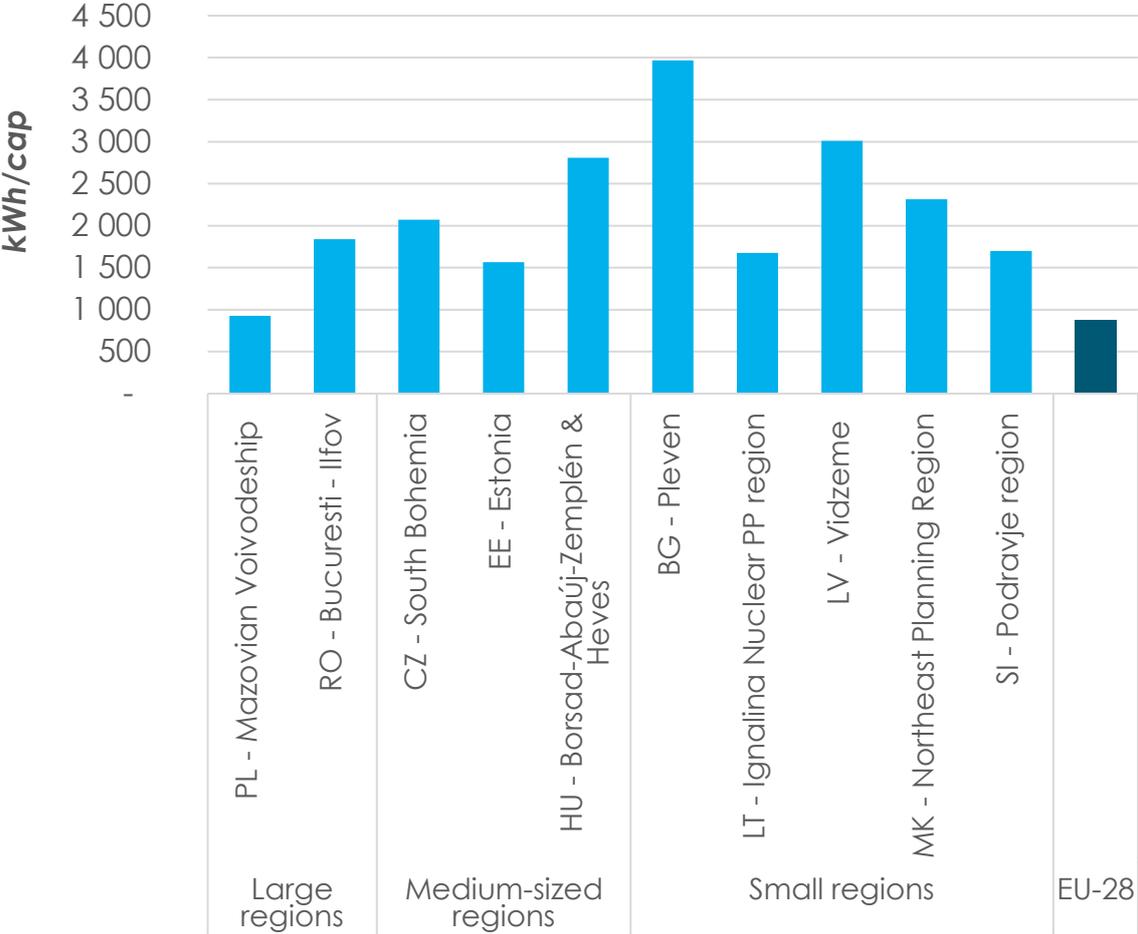

For the roadmapping process it is essential to establish a solid baseline before the actual roadmapping, designing of scenarios and planning of actions can start. While identifying the 10 focus regions partners reported back that energy data on regional level is mostly not systematically collected by regional authorities and therefore not easily available. The data collection has therefore been done by the PANEL2050 partnership.

In order to get a better understanding of the energy-related status quo of the focus regions the partners will prepare Regional Energy Profiles (REP). The REPs gave a comprehensive analysis of local energy production, imports, exports and energy consuming sectors as well as analyze strengths and challenges with regard to the transition towards a low carbon community. Here are the main findings of the Regional Energy Profiles.

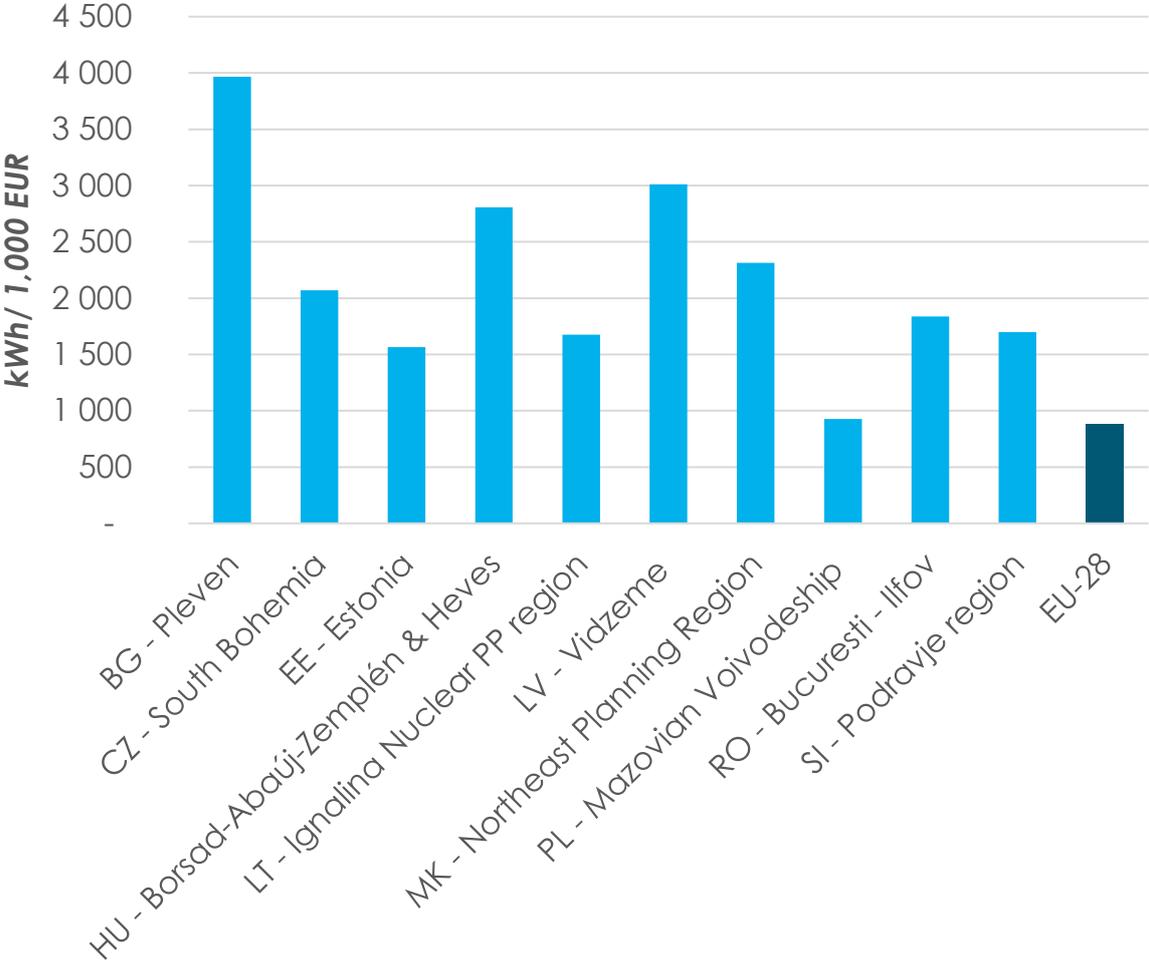

The 10 presented regions can be categorized according their population size and final energy consumption.

The larger regions Mazovian Voivodeship (PL) and Bucuresti-Ilfov (RO) show a lower final energy consumption per capita than the other regions – which is not surprising as the energy consumed by general infrastructure and economic activities are communally shared by a larger size of population. But this trend cannot be observed comparing the other size groups. The reason is that these regions are quite different in economic activity, which proves to be a larger influencing factor than population. Most of the regions are in the area of the EU-28 average (25,000 kWh/cap).

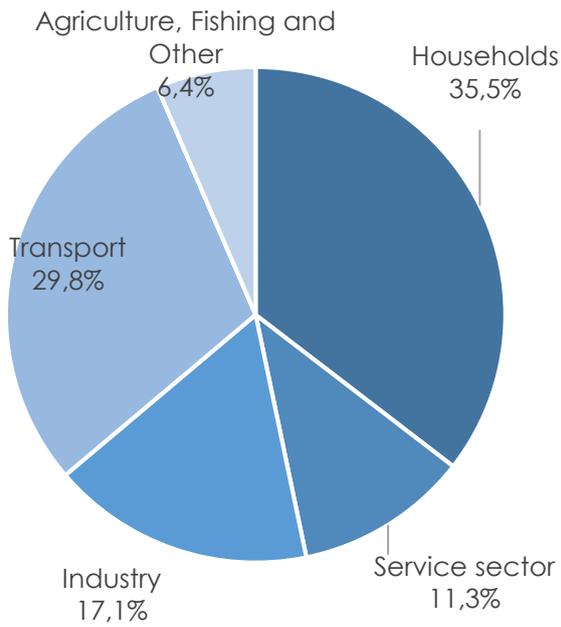

Looking at energy intensity of the regional economy using the indicator kWh per 1,000 EUR GDP. Again, the regions covered here are quite different and can't be divided into specific categories. The EU-28 average considering only final energy consumption lies below all of the presented Central and Eastern European regions (880 kWh/ 1,000 EUR).

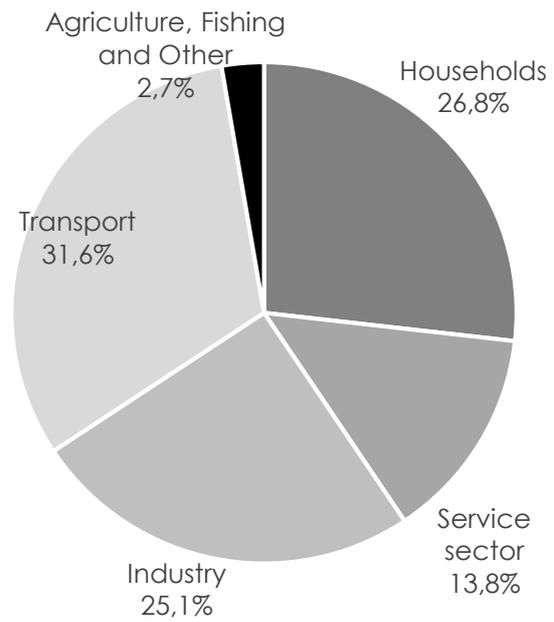

For most of the analyzed regions the households present the largest energy consuming sector with 30-50 % of the regions final energy consumption. The transport sector makes a close second place with 15-40 %.

The energy consumption of the service and industry sector highly depends on the characteristics of the region. E.g. energy consumption of the industry sector ranges from more than 40 % in Hungarian regions Borsad-Abaúj-Zemplén & Heves to only a view percentage point in the Macedonia Northeast Planning Region.

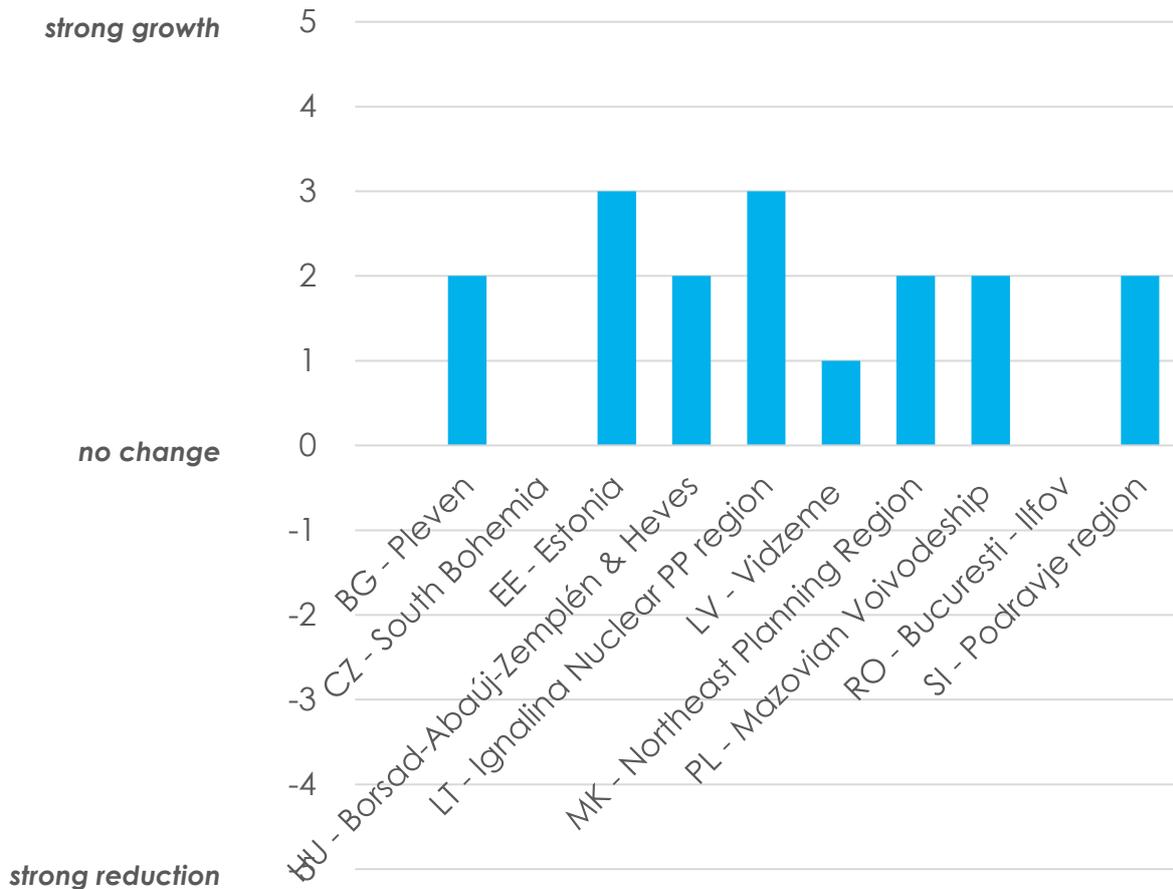

**Partner regions average**

**EU-28**

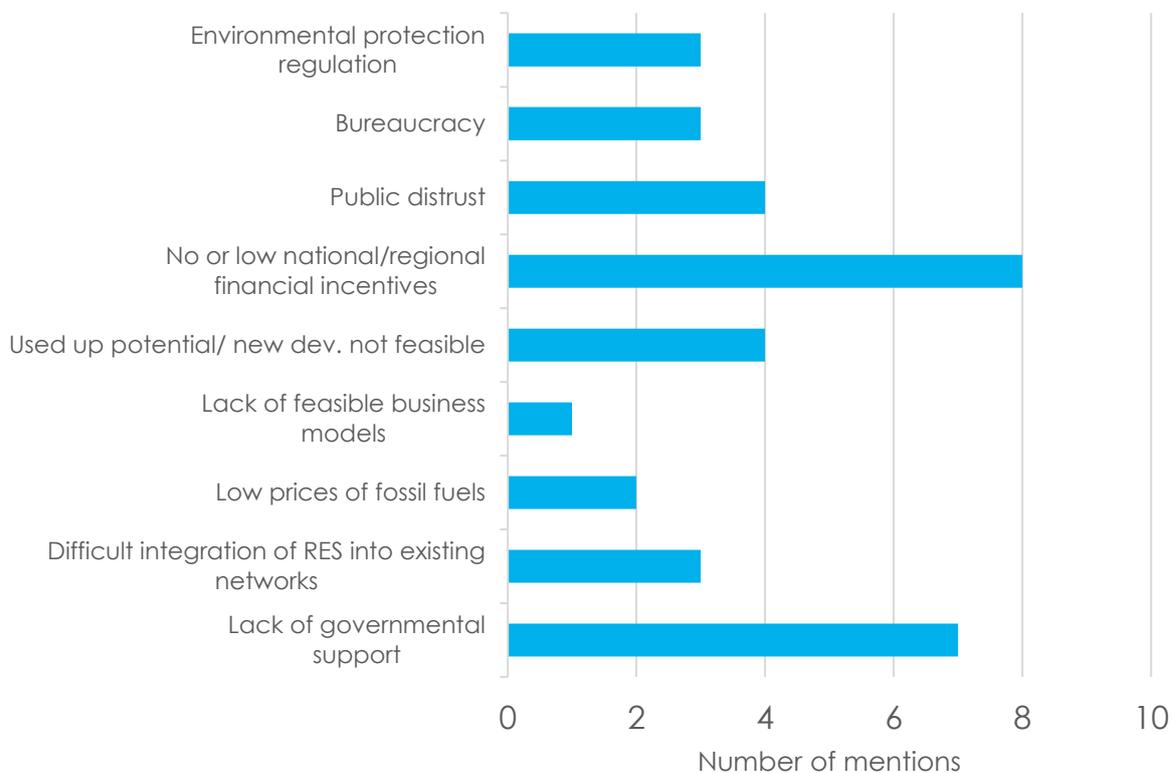

Different from the observed trends in energy consumption, the regions show a clear trend when it comes to renewable energy production. Almost all regions expect a slight to medium growth of renewable energy capacities in the coming years.

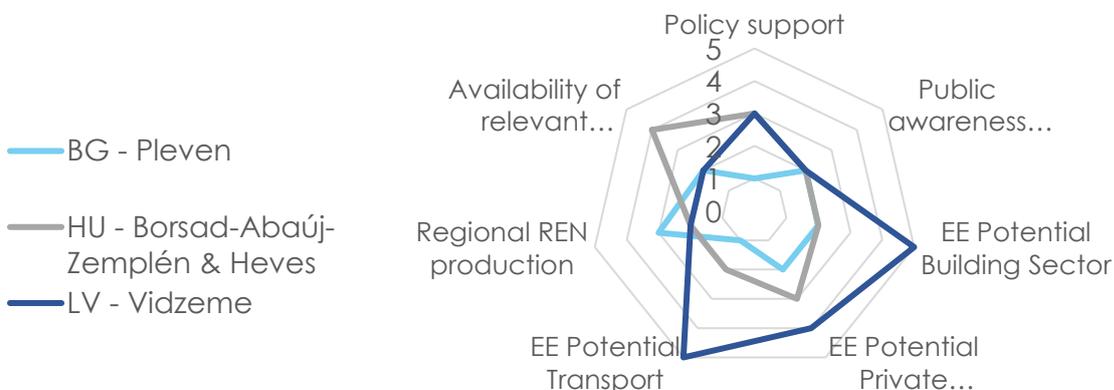

### Barriers for Renewable Energy Development

The lack of financial incentives and other governmental support was identified as the main barrier for renewable energy development- mentioned in 8 (respectively 7) of 10 regional energy profiles. Apart from missing financial incentives, other strong barriers for CEE regions mostly concerned with framework conditions for REN applications and a relative high number (4 regions) mentioned that there is still public distrust to overcome regarding REN technologies.

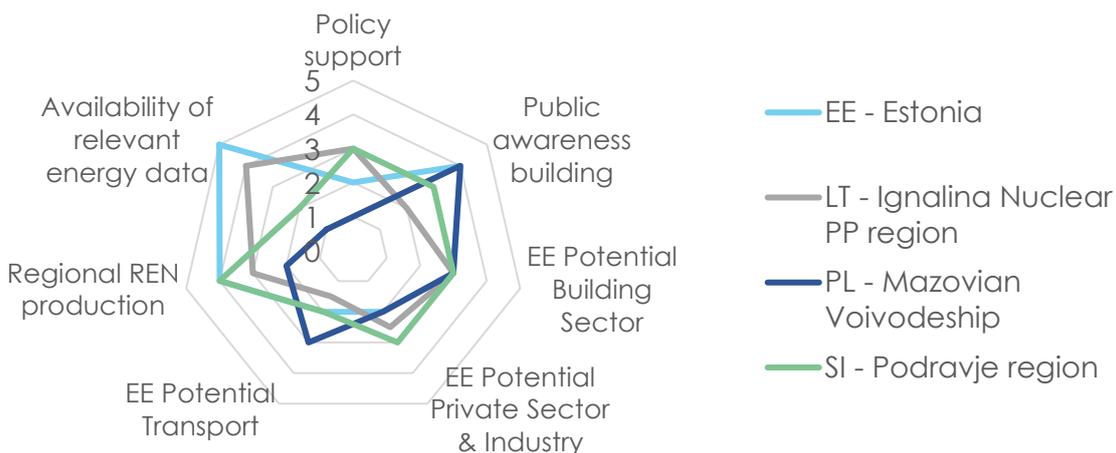

Regions with similar energy intensity were clustered in the following figures. The listed framework conditions were assessed using a scale from 1 (potential unused) to 5 (potential fully used).

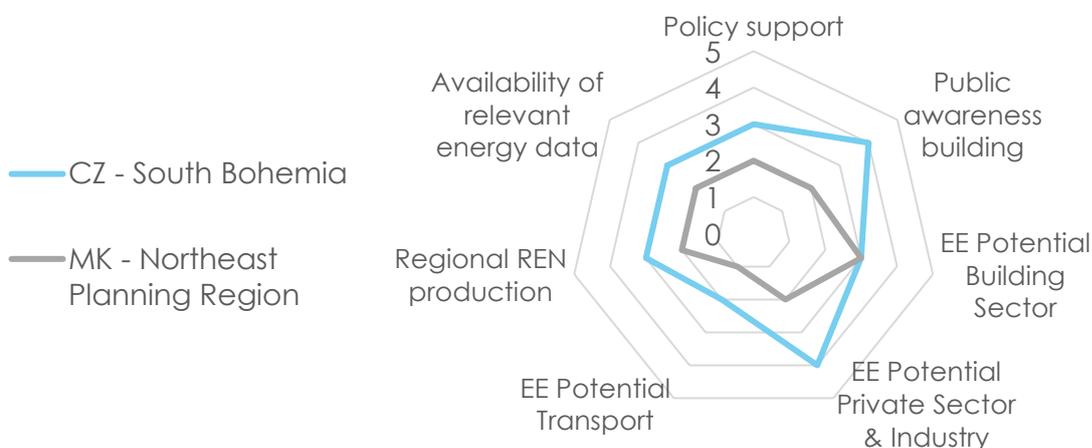

### Regions with comparably high energy intensity

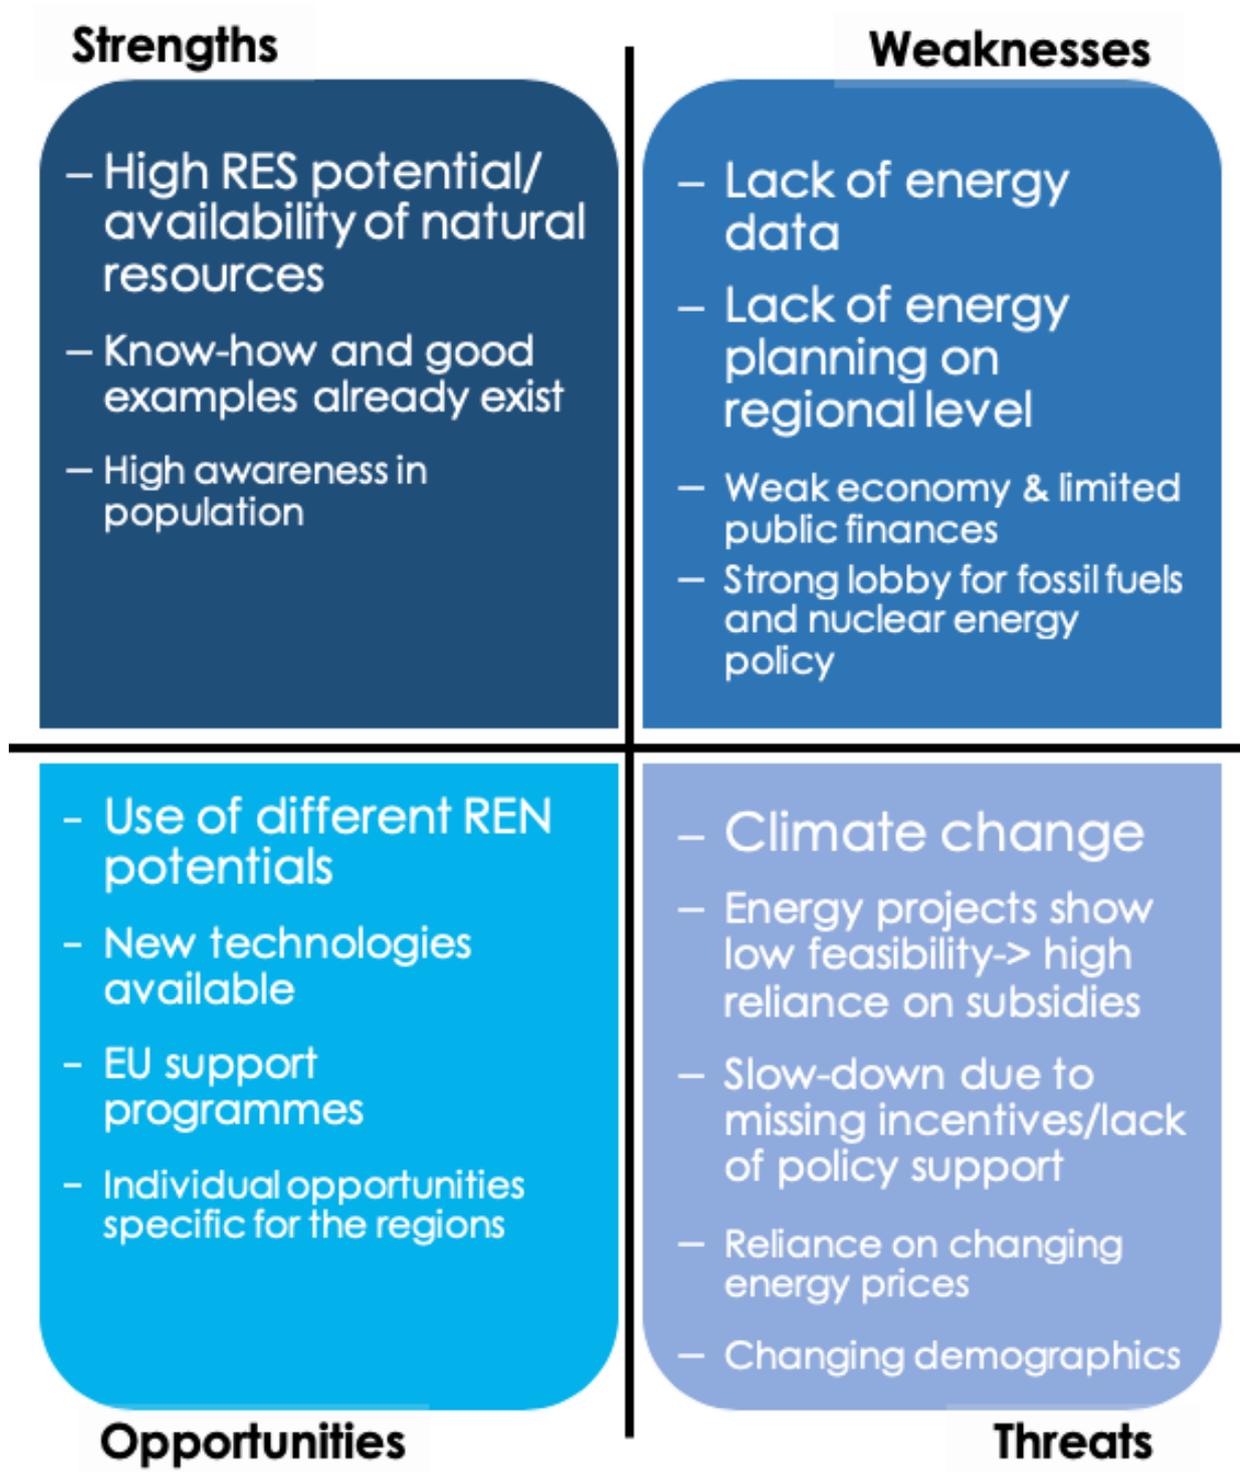

### Regions with medium energy intensity

### Regions with lowest energy intensity

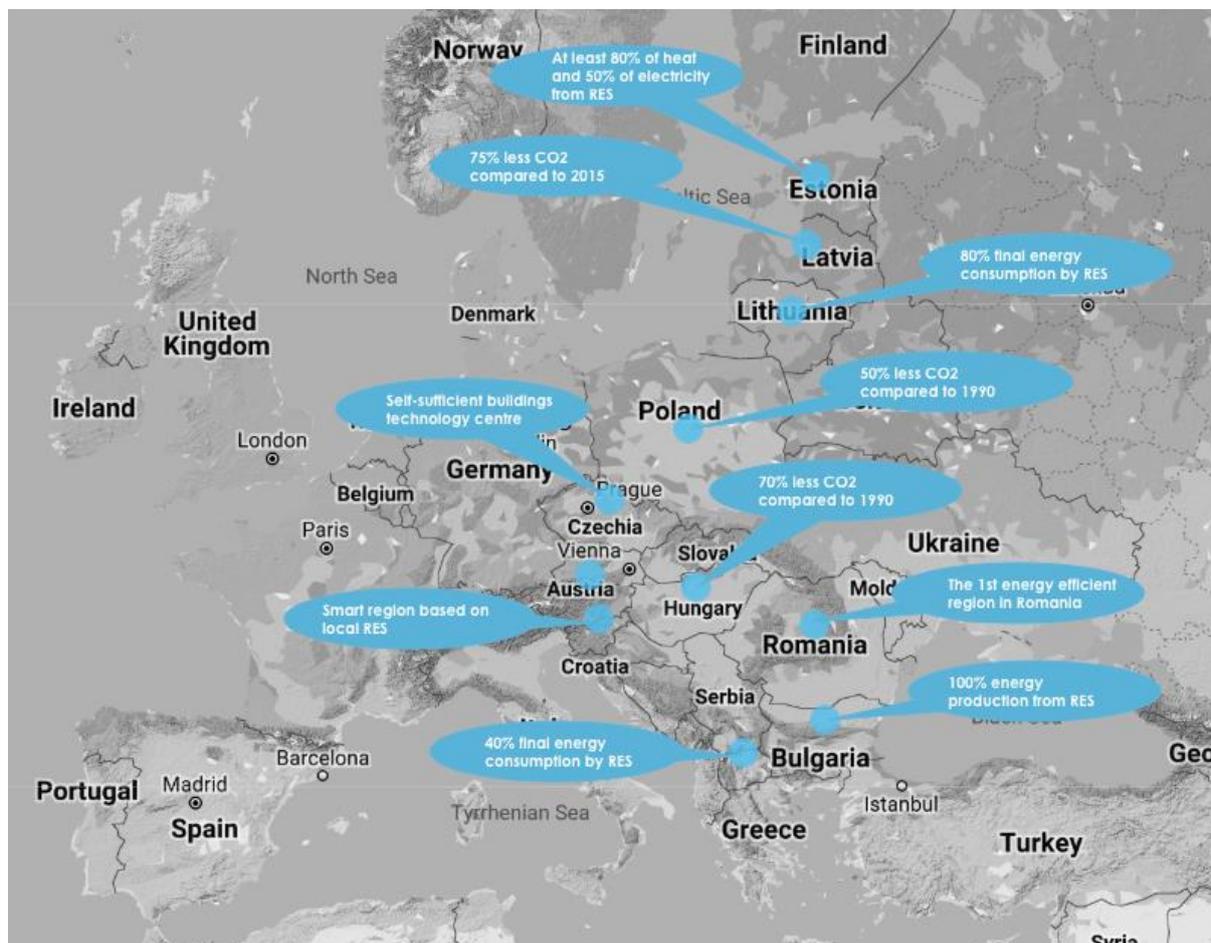

The REP was further used to steer the choice of which stakeholders needed to be involved and how to involve them in the roadmapping process (e.g. as part of implementation team, for the endorsement by policy-makers, multipliers, etc.). The analysis of the REP showed major influencing factors regarding the energy balance or carbon emissions. The identified sectors and its stakeholders should have been in the focus of further activities and specifically addressed in the roadmap.

To find out more refer to "Energy Efficiency Situation of Central and Eastern European Region. CEESEN, 2018"

### Regional vision (D3.3)

In principal Regional Vision are related to whole Roadmap and Action Plans (AP) as in particular AP are concrete measures fulfilling the Regional Vision. The vision constitutes the headline and guiding principal of the Roadmap.

All vision statements refer to a development paths with a time horizon until 2050. The visions take into consideration already existing targets (national or EU-wide), e.g. for 2020 and 2030 – if possible, broken down to regional level). All visions contribute to the national and EU-wide climate change mitigation strategies and targets. In the formulation coherency of the vision with other policy documents was observed, e.g. economic and regional development, employment strategy, agriculture policy, etc. Consistent with the project objective the vision described the regional interpretation and contribution towards a low-carbon economy.

An analysis of the vision documents showed that the focus regions approach the path towards a low-carbon economy in different ways. The chosen development targets and paths strongly depended on the regional characterizes. Both institutional framework conditions as well as geographical/resource-wise characteristics influenced the direction of the stated targets.

The 10 visions focus each on specific region. Most visions (8 out of 10) directly mentioned the needed increase of the renewable energy share as essential component to reach the

low-carbon economy. 6 of these regions also claimed increased energy efficiency as complementary condition. The role of innovative technologies and in particular the use and development support for smart energy production and consumption technologies was emphasized.

A couple of regions pledged to become forerunners in their countries and EU-wide, e.g. the region of South Bohemia (CZ) through setting the cornerstones for establishing off-grid buildings as building standard in South Bohemia, Bucharest-Ilfov region aiming to become the first energy efficient region of Romania, or the Podravje region (SI) becoming a forerunner in terms of smart energy systems.

Specific barriers were identified which are at the moment hindering the development towards a low-carbon economy and need to be addressed in order to reach the vision. A significant barrier for the realization of the vision is the low availability of domestic expertise and consultancy services both for public and private sector. PANEL2050 already started to address this barrier through focused regional training during the project duration. Trainings and knowledge transfer will also play an important role in the future to realize the vision.

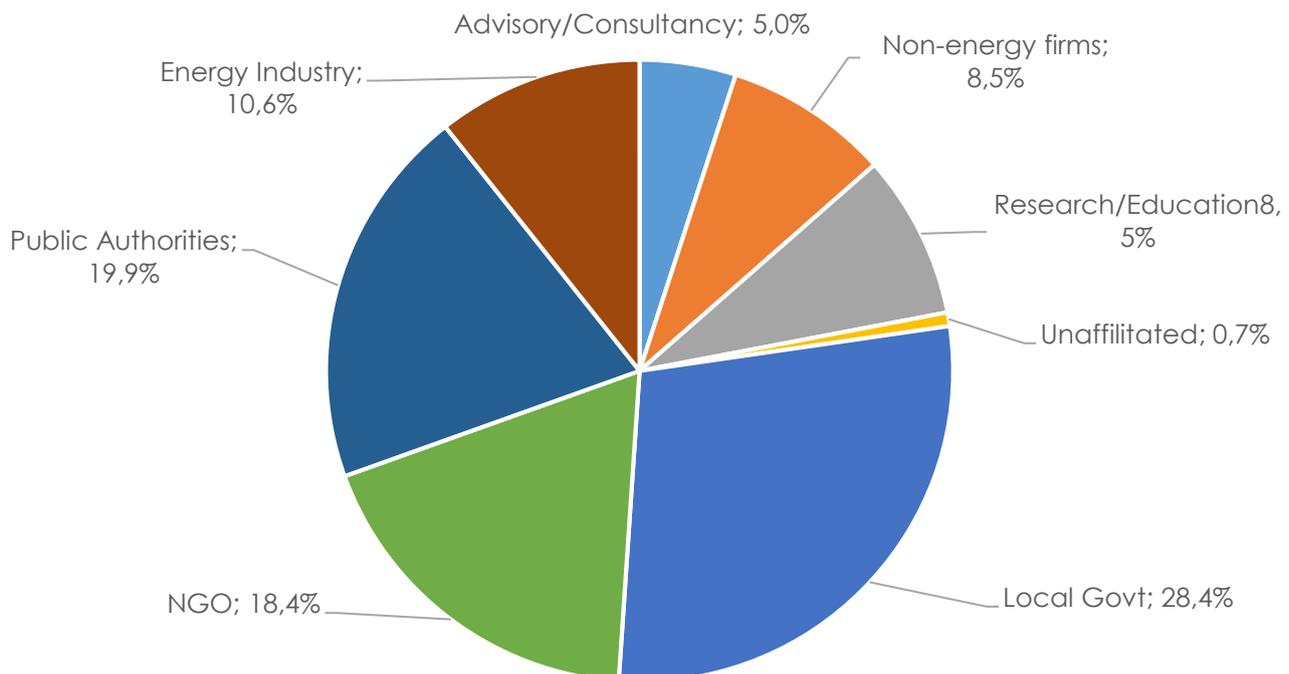

Moreover, there is a lack of awareness in the general population about climate change mitigation and the influence of the energy sector or individual energy consumption on GHG emissions.

Partners from the focus regions together with their stakeholders identified a certain lack of political will to support and implement a transition to a low carbon economy through legislation changes or strict and binding policy targets. At least 5 of the focus regions are encountering this problem. This includes also bureaucracy for approval of RES facilities, inconsistencies between policy strategies (e.g. environmental and economic development) and a strong commitment to conventional and centralized energy systems.

The visions were developed with strong involvement of different stakeholder groups. In almost all cases local municipalities were involved in the determination and formulation of the vision statement. In some cases, e.g. MK, also regional government representatives were included to ensure the endorsement of the vision. Strong partners in the development process were experts from the energy sector as well as representatives of interest groups and NGOs. Where the private sector plays an important role for the implementation of the vision, e.g. in South Bohemia (CZ), Vidzeme's region (LV) and Mazovian Voivodeship (PL), representatives of local businesses, including technology providers were included as well.

In the final Roadmap document the vision acted as introduction to the Roadmap: a brief description of selected energy vision, its potential and expected impact for the region ideally based on data from the previous Regional Energy Profile analysis or explained if this linkage to concrete energy-related challenges in the region.

Following figure shows which type of stakeholders were engaged in Visioning process:

To find out more refer to "*Regional Visions for Sustainable Energy Future. Synthesis report on CEE region. CEESEN, 2018*".

### **Roadmap (D3.5)**

The roadmap document is the heart of the process channeling baseline analysis and vision into a concrete pathway towards a sustainable energy future. The document is divided into particular strategical challenges which have potential to drive the region towards the set vision, i.e. priority areas. Each priority area was defined and described including regular milestones of the development towards the vision (= describing a business-as-usual scenario in comparison with a scenario in order to reach the vision).

Each priority area was described in a uniform way covering the following topics:

- 1) Conditions and challenges for further development mainly from the following point of views: R&D, know-how and technology transfer, stakeholder collaboration, public measures, strategical activities, policy
- 2) Stakeholder list covering public institutions, R&D, business sector, public including their influence share on given priority topic
- 3) Target group list covering public institutions, R&D, business sector, public
- 4) Financing and other sources for implementation of suggested strategy activities

To find out more refer to "*Roadmaps Towards a Sustainable Low-Carbon Economy. Collection of Roadmaps from CEE countries. CEESEN, 2019*" and see the chapter *Energy Roadmaps*.

### **Regional Action Plans (D3.7)**

Based on priority areas 10 concrete and detailed Action Plans were developed with following structure:

- 1) Definition of the measure / action – in relation to given priority topic, financing, justification of inclusion to Action Plans and methods of solution.
- 2) Currently running projects, measures including their actors and results. Potential for utilization of these results.
- 3) Suggested solutions – innovations, education, coordination, measures, research topics. Summary of outputs and their impacts on the region.
- 4) Main potential participants and partners – public institutions, R&D, business sector. Identification of guarantor who should come from the public authority, furthermore other key actors should be listed including international partners.
- 5) Estimated costs, financing sources and required measures to support for given Action Plan's implementation.
- 6) Target and monitoring indicators including a monitoring methodology
- 7) Time plan including milestones and deliverables in time.

By providing a uniform structure and methodology partners were required to think about and plan for all of the above-mentioned dimension of the Action Plan.

## Stakeholder Engagement and Forerunner Concept

Stakeholder Engagement was a strategic approach for engaging the community in the local energy management. Stakeholders were invited to participate in the long-term energy planning, bringing their knowledge and validation into the process. Regional and local actors have been involved in the planning and implementation process from the beginning to guarantee success of the effort. They are supported by engagement experts and capacity building activities. It is important that the planning process builds on existing local expertise and knowledge as much as possible.

The PANEL 2050 model used the participatory approach for stakeholder management with a systematic approach to identify and engage stakeholders. This included the following steps):

- Defining different aspects of the social and natural system affected by the planned decision or action
- Identifying individuals and groups who are affected by or can affect those parts of the system
- Prioritizing these individuals and groups for involvement in the decision-making process
- Convincing these identified stakeholders to participate in planned efforts
- Regularly interacting with these stakeholders at key points in the process to ensure that they continue to be engaged

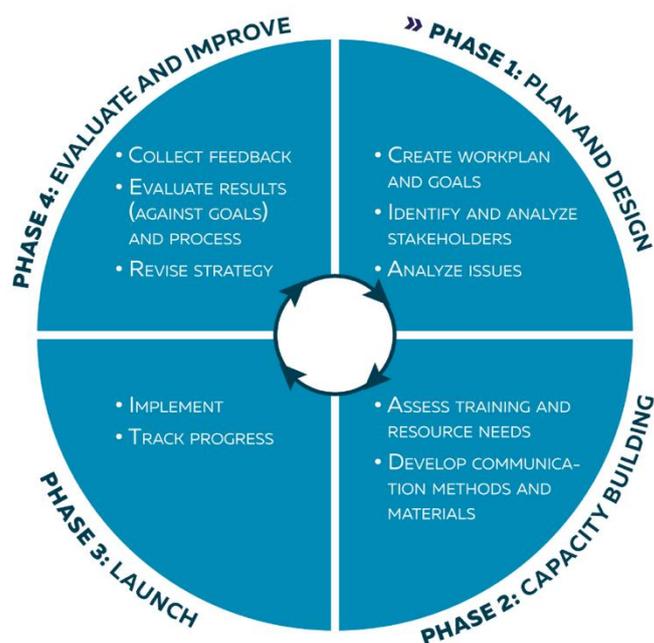

Figure 1. Engagement Model

The PANEL 2050 engagement model consists of three main parts:

1. Capacity building actions bring important stakeholder on board and empower them for the roadmapping process.
2. The active participation in the roadmapping process takes places.
3. CEESSEN networking platform was used for engaging and developing networks on a wider scale.

## Capacity building actions

PANEL 2050 conducted multifaceted actions to build the capacities of the local stakeholders. The empowering actions consist of 4 components:

- **Train-the-Trainer Workshops** - Focused on providing the practical skills and technical knowledge needed by PANEL partners to be able to train local stakeholders to lead roadmapping processes –10 Stakeholder Engagement Persons (SEP)s were trained among partners. SEPs led the engagement process throughout the project.
- **Local Training** – conducted based on the PANEL 2050 curriculum, 1240 participants were trained in total.
- **In-Depth Training/Forerunner Bootcamp** - In-depth skills training for key stakeholders who were taking leadership roles in their communities (forerunners) - 22 stakeholders were trained in total. 13 out of 22 were actively involved in the local roadmapping processes. In Hungary, Romania bootcamp participants were not involved in the roadmapping teams and visioning process.
- **Energy Advocacy Curriculum and Guidebook** – Brought together and expanded on the content of the previous activities in one manual that was used by partners and other organizations seeking to promote sustainable energy in their communities. It also can be used as a study book of all the relevant topics of sustainable energy advocacy.

### Train the Trainers

To better understand the potential role of TtT activities in efforts to promote sustainable energy advocacy capacity, it is instructive to examine the results of the series of train the trainer workshops for partners that TREA and UTARTUARTU staff conducted as part of the PANEL 2050 project. During the TtT workshops were trained 22 PANEL2050 staff members of the project including **10 Stakeholder Engagement Persons (See chapter “Forerunner Involvement”)**. In total, 2 TtT workshop was conducted during the 2<sup>nd</sup> and 3<sup>rd</sup> project meeting.

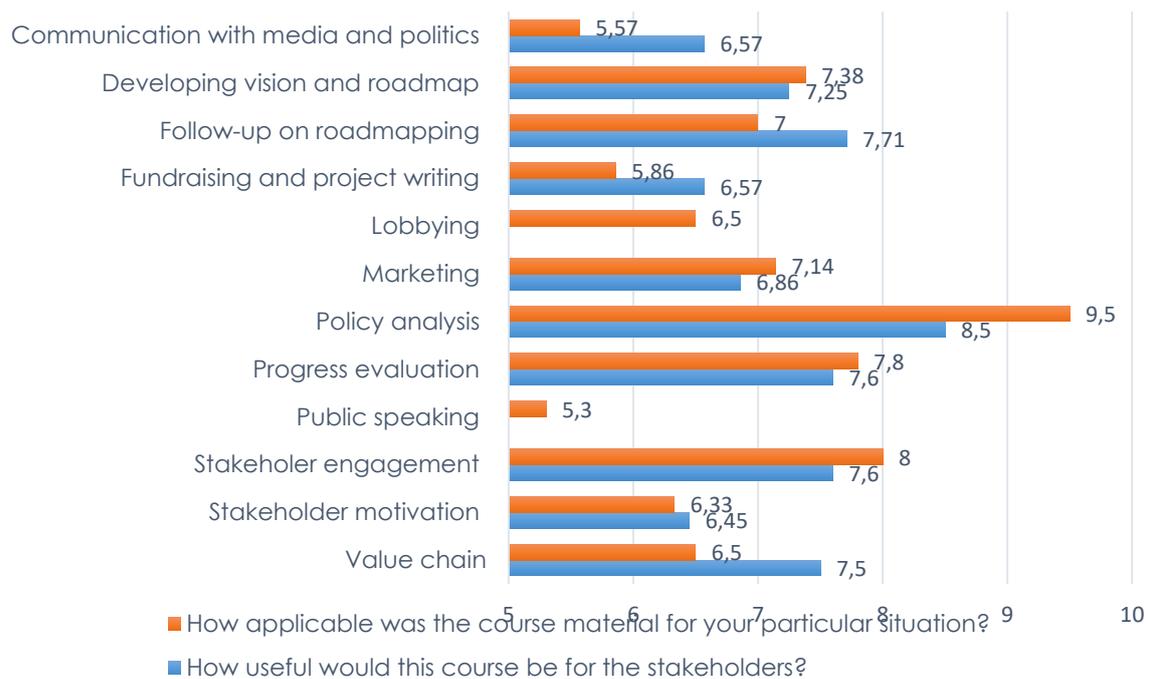

Figure 2 Usefulness and Applicability of TtT topics

The main target audience of TtT workshops were the Stakeholder Engagement Persons (SEPs) from each partner, who would be providing local stakeholders with training and technical assistance to build their capacity in preparation for their engagement in the roadmapping processes. The topics for TtT workshops were agreed to by partners during the second project meeting in Ignalina and are indicated in the graph above, the University of Tartu identified appropriate experts to conduct these lectures. Lecturers came from inside UTARTU, inside the PANEL consortium and in a few cases, were experts with specific skills and experience from Estonia.

After each training, participants were asked to give feedback on several aspects of the training. Based upon the feedback, the trainings were of mixed usefulness. Although all topics were rated as being at least 5 or above (out of 10) in terms of usefulness and applicability to local stakeholders, only one topic was rated above 9 (Policy Analysis). Trainings on Value chain analysis, Stakeholder Engagement, Progress Evaluation, and roadmapping were all rated as being 7 out of 10 or higher both in terms of the usefulness and applicability of the materials and content.

Three topics were rated below 6 in terms of applicability of the material for their situations - Public Speaking, Fundraising/Project Writing and Communication with Media. Regarding public speaking, 30% of participants said that the instructor explained the material only somewhat clearly (and 20% not clearly). The major issue with fundraising/project writing appears to be that not enough time was devoted to it, as indicated by 60% of the participants. As for Communication with Media, 40% of the participants believed that the training materials were only somewhat informative and useful and 50% thought that the material was only explained somewhat clearly (and 10% not clearly).

Within the PANEL 2050 project, the results of this feedback were used by partners to shape what types of training was offered to stakeholders as described in the following sections.

## Regional Training and Bootcamp

PANEL staff who participated in the TtT activities provided trainings to their local stakeholders. Partners notified organizations in their region about the local energy advocacy trainings. Partners developed different strategies for targeting training participants and how to best engage them. This was affected by the widely different profiles that exist between regions (i.e. energy supply mix, market composition, skills and expertise of the partners and size of the areas)

It was originally intended to conduct local trainings based entirely upon the curriculum. However, after engaging with their stakeholders, many partners expressed the idea that our approach was too 'top-down' and that local training needed to be more tailored to their stakeholders' needs. As a result, a five-step process was initiated, as depicted in the figure below. Once stakeholders were identified, their training needs were assessed while partners determined the training capacity that they had access to (either inside or outside of their organizations), based upon this, specific training topics were selected and appropriate trainers identified.

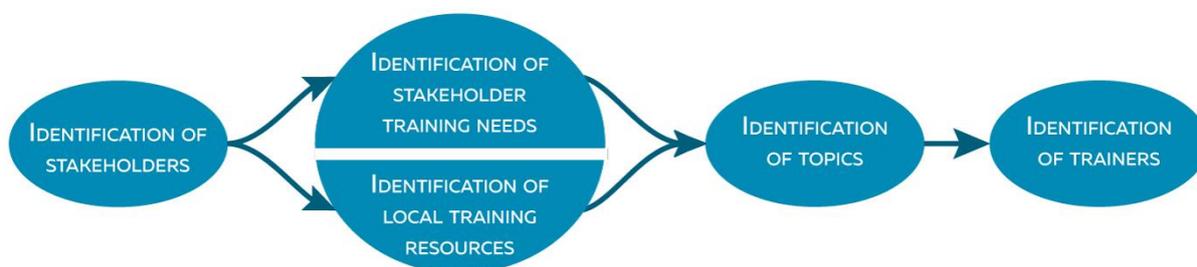

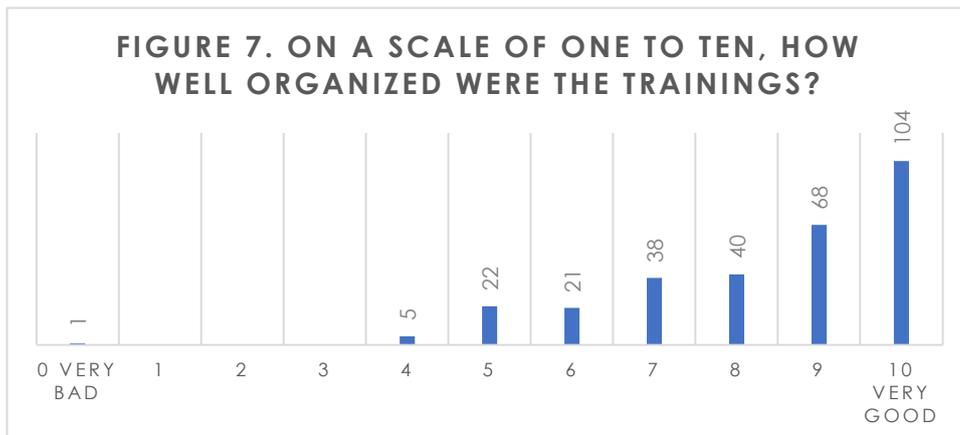

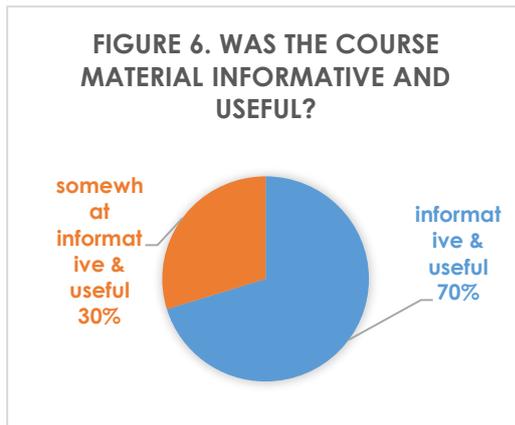

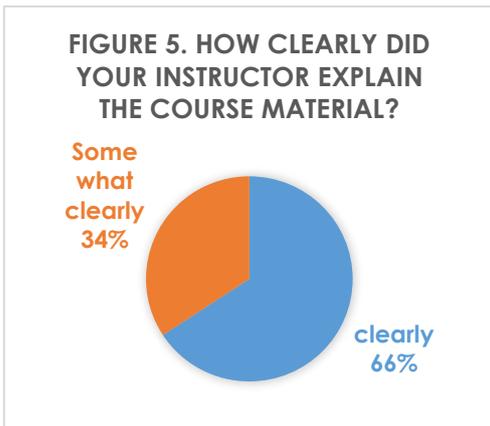

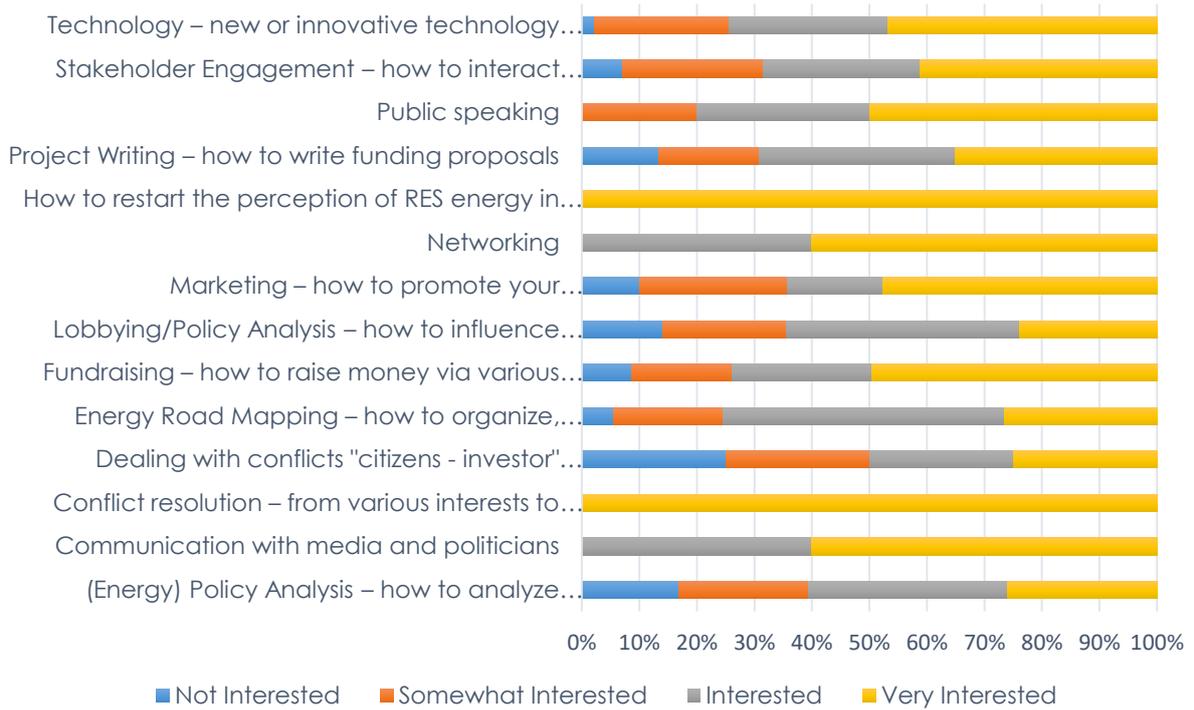

Figure 3. PANEL Local Training Process

Partners conducted surveys with their stakeholders to identify the actual level of demand for various training topics (partners from Hungary and Bulgaria were unable to due to a lack of time). **1042 total stakeholders responded**, and as can be seen in figure 4, amongst our stakeholders, there was broad interest for nearly all the training topics. Whereas respondents were mixed in terms of interest in stakeholder engagement, there was near universal interest in stakeholder analysis, resolving the conflict between stakeholders and networking. Likewise, despite mixed interest in marketing and lobbying/policy analysis, respondents were widely interested in related topics such as improving the perception of RES and communication with media and politicians.

Figure 4. Training topics

**1240 people** in total participated in 43 local trainings (which exceeding the goal of 240 set in the GA). Of this, 298 (24%) submitted feedback forms. Based upon this feedback, participants were generally satisfied with the trainings, with 71% of respondents rating the trainings as being well organized (8 or more out of 10), 66% indicating that the material was clear and 70% that it was informative and useful (see Figures 5 - 7).

Bellow, are descriptions of the training activities carried out in each partner region.

### **MAE Poland**

Mazovia Energy Agency conducted 5 regional trainings in 5 municipalities with 147 participants in total.

<b>Title of the event</b>	<b>Date, place</b>	<b>Focus</b>
<i>Possibilities of financing activities related to improving air quality in Mazovia. Project preparation and project management - Transition to low-carbon energy? Together it is possible.</i>	<i>15.09.2017, Skórzec</i>	<i>Save energy - protect the climate; Possibilities of financing activities related to improving air quality in Mazovia; Energy planning in the commune including dispersed energy sources; Energy management in the commune – a way to a low-emission economy.</i>
<i>Possibilities of financing activities related to improving air quality in Mazovia. Project preparation and project management - Transition to low-carbon energy? Together it is possible.</i>	<i>15.09.2017, Wodynie</i>	<i>Energy management in the commune – a way to a low-emission economy; Replacement of heat sources in residential buildings - project preparation and project management; Strategic energy partnerships PPP and energy cooperatives.</i>
<i>Possibilities of financing activities related to improving air quality in Mazovia. Project preparation and project management - Transition to low-carbon energy? Together it is possible.</i>	<i>22.09.2017, Kotuń</i>	<i>Training for stakeholders on transition to low-carbon community</i>
<i>Possibilities of financing activities related to improving air quality in Mazovia. Project preparation and project management - Transition to low-carbon energy? Together it is possible.</i>	<i>22.09.2017, Siedlce</i>	<i>Possibilities of financing activities related to improving air quality in Mazovia; Municipal energy strategy and hierarchical planning in the commune; Energy management in the commune – a way to a low-emission economy; Replacement of heat sources in residential buildings - project preparation and project management.</i>

Possibilities of financing activities related to improving air quality in Mazovia. Project preparation and project management - Transition to low-carbon energy? Together it is possible.	29.09.2017, Korczew	Training for stakeholders on transition to low-carbon community
---	------------------------	---

### WWF Hungary

WWF Hungary conducted 1 regional training with 17 participants.

<b>Title of the event</b>	<b>Date, place</b>	<b>Focus</b>
Energy transition in theory and practice	02.02.2017, Sátoraljaújhely	High-level training for local stakeholders about the different aspects of energy transition: theory, policy updates, and practical implementation

### EMU Estonia

EMU conducted 6 regional trainings with 339 participants in total.

<b>Title of the event</b>	<b>Date, place</b>	<b>Focus</b>
Innovation in renewable energy	2. November 2017, Tartu	Wide-scale training on innovations in renewable energy sector. Overview of latest developments and trends in different renewable energy fields.
Financing renewable energy projects	23. November 2017, Tartu	Practical training on financing possibilities for renewable energy projects in Estonia. Overview of national and international possibilities and unconventional funding.
EU financing mechanisms for sustainable energy projects	30. November 2017, Tartu	Practical training on EU financing mechanisms for sustainable energy projects on local level
Project writing for local governments	8. December 2017, Tartu	Practical training about writing EU level projects for local governments
Biomethane as transport fuel	24. January 2018, Tartu	Informative training for biogas network development stakeholders on new regulations and financing possibilities for different parts of the biogas chain

Planning energy management, creating sustainable energy roadmaps	1. March 2018, Tartu	Training on energy management planning and visioning.
--	----------------------	---

### **WWF Bulgaria**

WWF BG conducted 5 regional trainings with 169 participants in total.

<b>Title of the event</b>	<b>Date, place</b>	<b>Focus</b>
Stakeholder engagement and motivation	06.12. 2017, Sofia	Basics of identification, evaluation and motivation of stakeholders
Combined training	17.05. 2018, Nessebar	Lobbying for sustainable energy development, Involvement of stakeholders, Roadmapping, Funding opportunities for municipalities and specifics of project writing
Energy planning as an instrument for sustainable development of Bulgarian municipalities	11.06. 2018, Gorna Malina	Instruments for sustainable energy development, Involvement of stakeholders, Roadmapping, Funding opportunities and successful practices in project writing
Combined training	27.07. 2018, Pleven	Involvement of stakeholders, Roadmapping, Funding opportunities Air pollution and instruments for energy planning for municipalities
Training on energy vision and roadmap	31.07. 2018, Sofia	Revision of the energy vision and roadmap process, action plan development, next steps

### **AgEnDa Czech Republic**

Agenda conducted 4 regional trainings with 65 participants in total.

<b>Title of the event</b>	<b>Date, place</b>	<b>Focus</b>
Regional energy in context	20.7. 2017, Prague	High-level training for public authorities – Regional energy policies in context

2020 Funding opportunities	28.11. 2017, České Budějovice	Basic introduction of the possibilities of funding innovative and R&D activities
New thinking and approaches	14.3. 2018, Prague	Practical training for biogas operators
Mobility in H2020	9.4. 2018, České Budějovice	Training for stakeholders on mobility within H2020 opportunities

### **LEASP Slovenia**

LEA SP conducted 3 regional trainings with 28 participants in total.

<b>Title of the event</b>	<b>Date, place</b>	<b>Focus</b>
RES and EE in practice - technologies and financing	7.3.2017, Ptuj	Training on financial mechanisms in energy sector, project writing, policy analysis and overview of innovation and latest developments in renewable energy sector.
Stakeholder Seminar	20.9.2017, Ptuj	Training on energy policy analysis and possibilities of founding energy related projects.
Energy planning	11.4.2018, Ptuj	Small group training on energy planning.

### **AEEPM Romania**

AEEPM conducted 10 regional trainings, one with 23 participants and 9 with participants estimated between 3-8 participants.

<b>Title of event</b>	<b>Date, place</b>	<b>Content / Results / conclusions</b>
Road Mapping Process.	28.07.2017, Bucharest	The main goal of this event was to discuss PANEL project framework and Road mapping process.
Road Mapping Process.	24.08.2017, Bucharest	First training on visioning and planning process
Road Mapping Process.	15.09.2017, Bucharest	Second training on energy planning process
Discussion Formulation On Of Regional Vision	27.10.2017, Bucharest	Training session – discussion on formulation of regional vision

Discussion Formulation Of Regional Vision	On Of	09.05.2018 Bucharest	Capacity building and re-drafting the regional vision concept
Road Mapping Process.		04.06.2018, Bucharest	Finalization of the regional vision for 2050 and drafting next steps in road mapping process + discussion on action plans
Road Mapping Process.		09.10.2018, Bucharest	Presentation of Roadmap and Action Plans to the Regional Council Office
Road Mapping Process.		27.11.2018, Otopeni	Presentation of Roadmap and Action Plans to the Municipalities
Road Mapping Process.		28.11.2018, Bucharest	Presentation of Roadmap and Action Plans to the Municipalities
Road Mapping Process.		29.11.2018, Buftea	Presentation of Roadmap and Action Plans to the Municipalities

### **LAEPRA Lithuania**

IAERPA conducted 4 regional trainings with 108 participants in total.

<b><i>Title of the event</i></b>	<b><i>Date, place</i></b>	<b><i>Focus</i></b>
<i>Project preparation - how to write project proposal</i>	<i>12.01. 2018, Ignalina</i>	<i>High-level training for public authorities about preparation of projects</i>
<i>Stakeholder engagement – how to interact and work with</i>	<i>12.01. 2018, Ignalina</i>	<i>Practical training for regional public authorities</i>
<i>Fundraising – from idea to realisation</i>	<i>12.02. 2018, Ignalina</i>	<i>Practical training for regional authorities, NGOs and municipalities</i>
<i>Marketing – how to promote your organization</i>	<i>12.02. 2018, Ignalina</i>	<i>Practical training for regional authorities, NGOs and municipalities</i>

### **VPR Latvia**

VPR conducted 6 regional trainings and 2 training in a form of study trips with 190 participants in total.

<b><i>Title of the event</i></b>	<b><i>Date, place</i></b>	<b><i>Focus</i></b>
----------------------------------	---------------------------	---------------------

Existing energy infrastructure -what is it and how to describe it?	25.04.2017., Smiltene, Latvia	Energy management in the municipalities and municipalities' involvement in the energy resources utilization planning: approaches and solutions
Data gathering and the development of a data basis	31.05.2017., Cesvaine, Latvia	Data collection and analysis in a municipality
Experience exchange trip	29.06.2017., Liepāja, Latvia	Leaders and forerunners in the energy sector. Importance of active engagement, Liepāja examples.
Energy planning	29.09.2017., Rauna, Latvia	Stakeholder engagement and its role in the energy planning process and fundraising and project application writing for EU programs
Energy management system (EMS) development and implementation process in a municipality	28.03.2018., Priekule, Latvia	Introduction about energy management system creation and introduction in a municipality and an organization: general requirements; energy overview; goals and action plans; implementation and actions + stakeholders' presentations and workshop on the topic
EMS development key principles for a municipality building	11.04.2018., Kocēni, Latvia	Step by step energy management development in a municipality building: energy overview, energy efficiency indicators, operative action and monitoring + stakeholders' presentations and workshops on the topic
EMS development for all municipality buildings	25.04.2018., Cēsis, Latvia	Energy mapping in the Vidzeme planning region, Step by step energy management development in several (all) municipality buildings: municipality energy policy, defining goals, action plans and defining priority actions, competency. Communication, documentation, procurement, and designing + stakeholders' presentations and workshops on the topic
Energy management and municipalities' energy plans	9.05. 2018., Valmiera, Latvia	If and how to link energy management to the municipalities' energy action plans? Why to do it? + concluding stakeholders' presentations on the training cycle

Energy day in Valmiera and study trip to Estonia	14-15 June 2018., Valmiera, Latvia Valga and Tartu, Estonia	Presentations of municipalities' Action plans, information about dissemination and an experience trip

<i>Development of Regional Energy Map 2050 for NEPR and Action Plan</i>	14.06.2018 Kumanovo	<i>Introduction</i> <i>Development of Regional Energy Roadmapping</i> <i>Development of Regional Energy Roadmapping for NEPR</i> <i>Development of the Action plans</i> <i>Exercises and discussions</i>

## Bootcamp

The Bootcamp was held over five days, to improve the skills and capacities of forerunners such as their ability to develop and implement energy roadmaps, promote sustainable behavior and advocate with the public and private sector to support sustainable energy initiatives. The 22 participants came from local government, NGOs and umbrella organizations across 10 different CEE countries. Participants were assigned 'homework' including the pre-assigned literature for each of the topics and shared information with instructors about their interests and backgrounds before the training began.

Evaluation results showed that the participants were satisfied with the course materials as indicated in Figure 8. For 44% of respondents the most useful were the marketing and communication course. Moderately useful were roadmapping materials (55%).

On the first day, students learned about the Roadmapping process and engaged in a practical exercise of formulating a regional vision. On day 2, these visions were then turned

into action plans that specified how they would be implemented. On the third day, participants received guidance on writing funding proposals and used this knowledge to develop their action plans into draft funding proposals. On the fourth day, students practiced different methods of stakeholder engagement and identified how they would involve different groups into their project proposals (as partners, clients/customers, dissemination targets etc.). On the fifth day, participants learned how to market their ideas and how to advocate for them at the political level.

## Training Curriculum

The PANEL 2050 Energy Advocacy Training Programme is a structured and integrated approach that was developed within the EU funded Partnership for New Energy (PANEL) 2050 project. The curriculum was designed by the Johan Skytte Institute of Political Studies at the University of Tartu (UTARTU) in consultation with fellow PANEL Partners the Tartu Regional Energy Agency (TREA), ConplusUltra (CPU), the Estonian University of Life Sciences (EMÜ) and WWF Hungary as well as experts in the fields of politics, stakeholder engagement, marketing and advocacy.

The PANEL 2050 curriculum combines theory with practice to create interactive educational content to strengthen the ability of organisations (such as PANEL 2050 project partners) to increase the energy advocacy abilities of their stakeholders. Finalizing the curriculum was delayed. It was supposed to be used when constructing the regional trainings. By the time when partners started to implement the trainings there was only available the draft of the curriculum. The WP2 supported partners to develop the study materials based on the draft of the curriculum. In this way, partners were able to implement the trainings. An initial version of the curriculum was completed in May 2017 and a second version in October 2018, which was updated based upon the feedback received within the PANEL 2050 project, from both trainers and trainees. The second version was also re-written slightly to make it more accessible to interested groups from outside of the consortium.

The intention of the curriculum is to provide guidance on how to:

- Identify and train staff capable of serving as Stakeholder Engagement Persons (SEPs) who can provide training, technical assistance and support to stakeholders within their community.
- Organize and hold workshops with stakeholders in their region on how to carry out sustainable energy planning, develop sustainable energy roadmaps, obtain resources, effectively communicate messages to the public and advocate with policy makers and the public for sustainable energy
- Identify important stakeholders who can act or are already acting as **forerunners** in their region, leading efforts towards low-carbon and sustainable energy activities
- Develop the skills and abilities of Forerunners to engage in effective sustainable energy advocacy at the local, regional, national and European levels

The curriculum illustrated how the various elements fit together to promote an increased knowledge of sustainable energy advocacy within the CEE region. It also lays out the conceptual framework that is the basis for the curriculum, including the theoretical and practical justifications for the content of the programme.

Section 5 describes in detail the various workshops and courses that comprise the curriculum. In addition to the topics of the workshops, the goals and learning objectives of

each are also provided, as well as suggestions on the frequency and duration of each. A reading list for each topic is also offered.

The curriculum includes recommendations on how to identify and select participants for trainings. The key participants in this context are influential stakeholders, whom we refer to as forerunners, who are leading the way towards low-carbon economies, via increased use of renewable energy sources and greater energy efficiency. Not only must they be active in the sustainable energy community, but they should be able to reach out to wider audiences to communicate with (and hopefully influence) as many relevant stakeholders as possible.

The curriculum also describes how capacity building organizations can identify and prepare trainers to conduct workshops. The method used by the PANEL 2050 project is offered to illustrate this approach. This is followed by a section focused on the various logistical decisions that must be made by organizations when planning to carry out trainings. The final section describes how in-depth training for forerunners should expand upon what is offered to other stakeholders. The example of PANEL 2050 is again offered, based upon our carrying out of the Forerunner Bootcamp.

## **Guidebook**

The training materials and curriculum were brought together in a guidebook that is accessible to actors from outside of the PANEL 2050 consortium who are interested in building the capacity of stakeholders in their communities to engage in roadmapping processes and sustainable energy advocacy.

The first version of Guidebook on Advocating Sustainable Energy in Central and Eastern Europe was finalized in September 2017 and updated in December 2018 with experiences from the PANEL2050 regional activities. In the development process the WP2 leader (UTARTU) formed a Guidebook team to bring together the expertise of the PANEL2050 team. UTARTU was responsible for chapters 1 (Intro), chapter 2 (Advocacy), 4 (Participatory Processes) 6 (Resource Development for Advocacy) and 7 (Project Writing and Management). CPU was responsible for chapter 5 (Road Mapping) and WWF was responsible for chapter 3 (Marketing and Advocacy). UTARTU with EMŮ edited and compiled the guidebook. To validate the relevance of the guidebook, the PANEL2050 Advisory Board was asked to review the document and provide feedback. Based on the reviews, the first version was updated and printed out for the CEESN Conference 2017 in Prague and the updated version for the final conference in January 2019.

The Guidebook provides guidance to stakeholders on how to move their communities towards more sustainable energy systems. It does so by addressing each step in the process – how to set up a road mapping initiative, how to market it to key target audiences, how to advocate for political support and how to obtain financial and other resources to support the whole effort. It was written in such a way that readers could study the whole process from start to finish or to focus only on those specific areas in which they need the most guidance.

The book contains practical exercises, in addition to theoretical background, which can be carried out by readers to analyze their environment and develop advocacy strategies. It also includes examples of various tools to be used by readers, such as sample letters of support/press releases, SWOT and Stakeholder analysis worksheets, and logical frameworks to connect different elements of an advocacy strategy. The second version published in 2018 also included short case studies of successful forerunners in Central and Eastern

Europe and other countries that illustrate how the various concepts described have been effectively been put into action.

The structure of the Guidebook is as follows:

- Chapter 1. Transition to Low Carbon Economy
- Chapter 2. Advocacy for Sustainable Energy
- Chapter 3. Marketing and Advocacy
- Chapter 4. Participatory Processes
- Chapter 5. Roadmapping
- Chapter 6. Resource Development for Advocacy
- Chapter 7. Project Writing and Management

The English version of the Guidebook is downloadable as a PDF on the CEESSEN webpage – [https://ceesen.org/?dml\\_download=advocating-for-sustainable-energy-in-central-and-eastern-europe](https://ceesen.org/?dml_download=advocating-for-sustainable-energy-in-central-and-eastern-europe).

## Forerunner Involvement

Engagement process started at the beginning of the project and followed the participatory approach described above. The PANEL2050 engagement process had several stages.

Stage 1. Setting up the team of PANEL2050 Stakeholder Engagement Persons.

Stage 2. Identifying and mapping potential stakeholders in the regions.

Stage 3. Engaging the stakeholders directly in PANEL2050 activities.

Stage 4. Supporting forerunners in roadmapping and visioning processes

### Stakeholder Identification and Mapping Process

Stakeholder Engagement Persons SEPs were identified by each partner. The SEP was the person inside the partner organization who was in charge of managing the stakeholder engagement process. The main task of the SEP was to identify relevant stakeholders from different sectors of society, including both those who are supportive as well as those that could be considered 'opponents' to efforts, such as certain industrial actors. This included identifying stakeholders that were not engaged in the current energy transition but could have a significant impact on the process. SEPs were also responsible for creating strategies for reaching out to stakeholders they have previously not communicated with – and creating rebuttals to the claims or arguments made by opponents. To do this, SEPs needed to establish good personal communication with the identified stakeholders, which often required attending different meetings (i.e. Chamber of Commerce or trade associations).

In this process, PANEL partners were in different situations and accordingly. For example, some partners already had a person identified who communicated with stakeholders, while others identified someone from amongst their staff to serve this function. It was agreed at the Kickoff meeting that WP2 leaders would write up a list of the responsibilities of the position and assist partners directly via the skype bilateral meetings. SEPs were mostly persons responsible for the communication in the organization or they were directly working with energy actors in their regions. As described above, **10 SEPs received training on energy transition advocacy via TtT workshops**. In total, throughout the project, there

were more than **40 bilateral skype meeting** with SEPs. The meetings monitored the engagement process in the regions and provided guidance and support to SEPs. **The project gained positive results by setting up the team of SEPs that helped to better monitor and oversee the process of engagement on the local level.**

After being identified and trained, SEPs engaged in mapping processes to categorizing stakeholders by their interest and influence level. At the beginning of the engagement process, SEPs identified and mapped **238 stakeholders**. SEPs did relatively successful work in identifying new stakeholders that they had not engaged with before, (35.7% were new stakeholders). The most dominant organization types identified were grassroots and local governments. This continued throughout the project, so that by the end, 1432 stakeholders were directly engaged in various activities, 55% of which had not been engaged previously by our partners.

Based on the methodology developed by the WP2 team, SEPs also categorized the stakeholders by their interest and influence levels. The stakeholders identified were mostly supportive of the transition process. **One weakness is that SEPs were not as successful in identifying opponents of the transition process and as later stages of engagement showed no opponents were engaged during the project.**

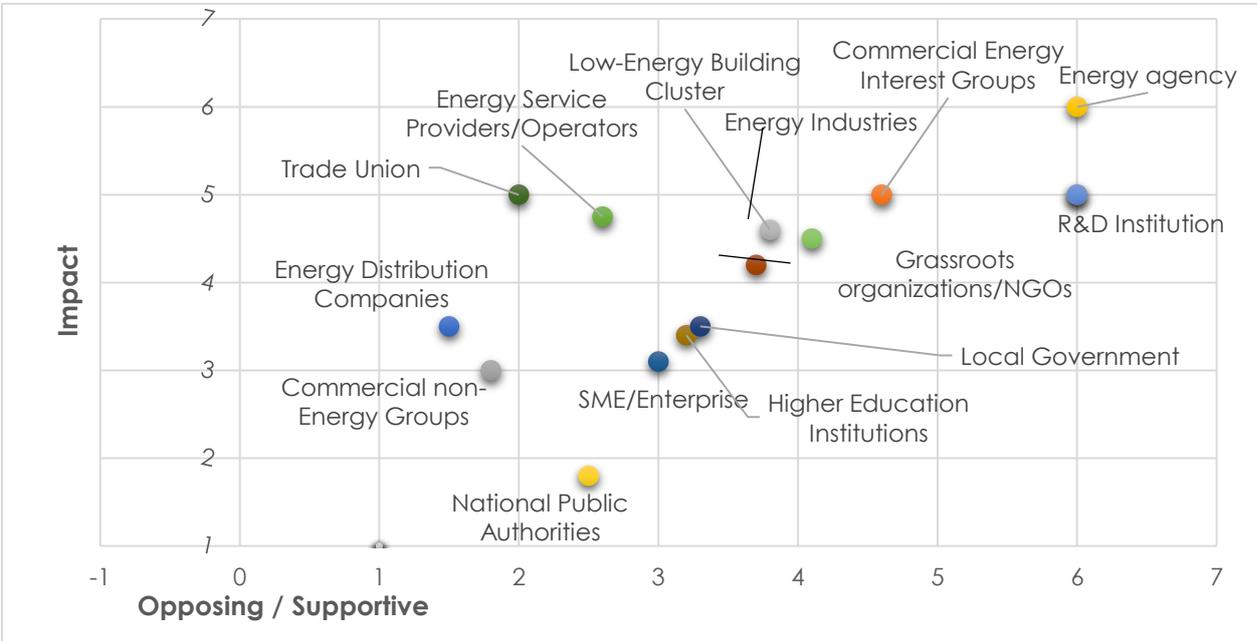

Figure 10. Categorization by impact and support

Results of setting up the team of SEPs, identification and mapping of stakeholders showed that having one person responsible for the engagement task is a good model to directly monitor the engagement process. One important factor is that the SEPs appointed in the beginning of the project stayed active throughout the whole process. All SEPs executed the basic tasks defined for them in the initial job description of SEPs.

**Engaging the Stakeholders and Supporting Forerunners**

Although the PANEL 2050 model focused on working with large numbers of diverse stakeholders, it also sought strategic engagement with key constituencies, especially with

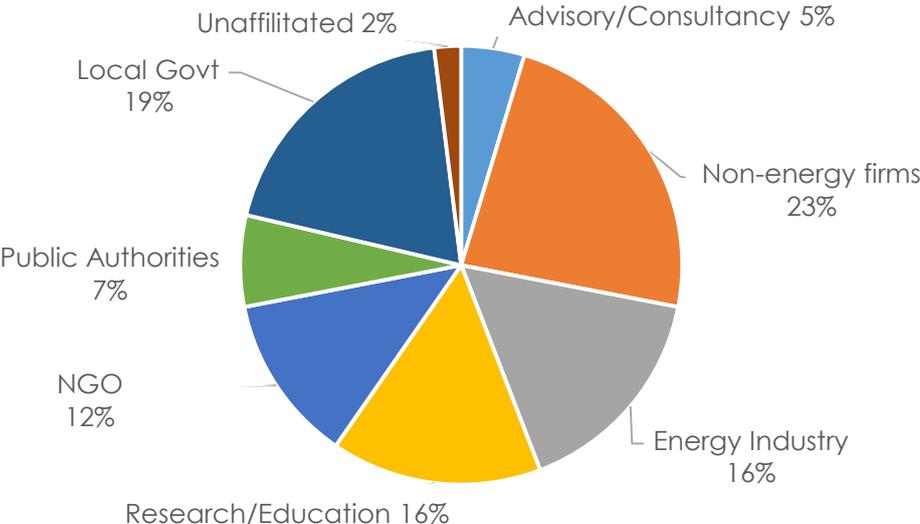

'forerunners' who could be more influential to other community members, capable of pushing forward road mapping efforts. At the beginning of the engagement process, partners identified important energy actors - that were potential stakeholders. These actors who participated in capacity building activities were considered PANEL stakeholders. Stakeholders who were continuously involved in regional trainings, visioning and roadmapping processes, and registering on CEESEN platform were identified as forerunners.

Forerunners served at least three distinct roles in the roadmapping processes. First, they were instrumental in helping to get important stakeholders to participate in the process. Second, forerunners took active role in the roadmapping process itself, participating in visioning workshops and in roadmap development. Finally, forerunners by commitment letter are suppose to monitor the implementation of roadmaps, pushing various actors in the government, business and other sectors to fulfill promises made.

With reference to the WP2 outputs within the scope of the PANEL 2050 project following levels of engagement for stakeholders were achieved:

- Stakeholders Involved/Informed: Stakeholders made aware of the issue of energy transition and offered access to tools – **2 450 members of CEESEN**
- Capacity Built: **1 240 Stakeholders** attended trainings on topics such as Financing Mechanisms, Project writing, Energy Planning, etc. –. **232 public officers** were directly trained.
- Engaged: **126 Stakeholders** participated in visioning and road mapping activities for their community –. Public officers from National Public Authorities, HEI, Local municipalities, Public energy agencies and companies – **659 public officers** in total.
- Forerunners: Stakeholders who assumed leadership roles – participating in multiple stages of activity (receiving training, and be member of roadmapping team efforts) – **95 stakeholders** participated in multiple stages of activity such as joining CEESEN, receiving training, and be member of roadmapping team efforts.

The following figure shows which type of stakeholders were engaged within the implementation of PANEL 2050 project.

The project strengthened further relations with the stakeholders that partner interacted before. Out of 1432 directly engaged stakeholders, 352 of them were previously engaged with project partners. Out of those 77% has been involved in the regional trainings. Partners did less successful work in terms of continuously engaging these stakeholders in the roadmapping team efforts (Less than 20%).

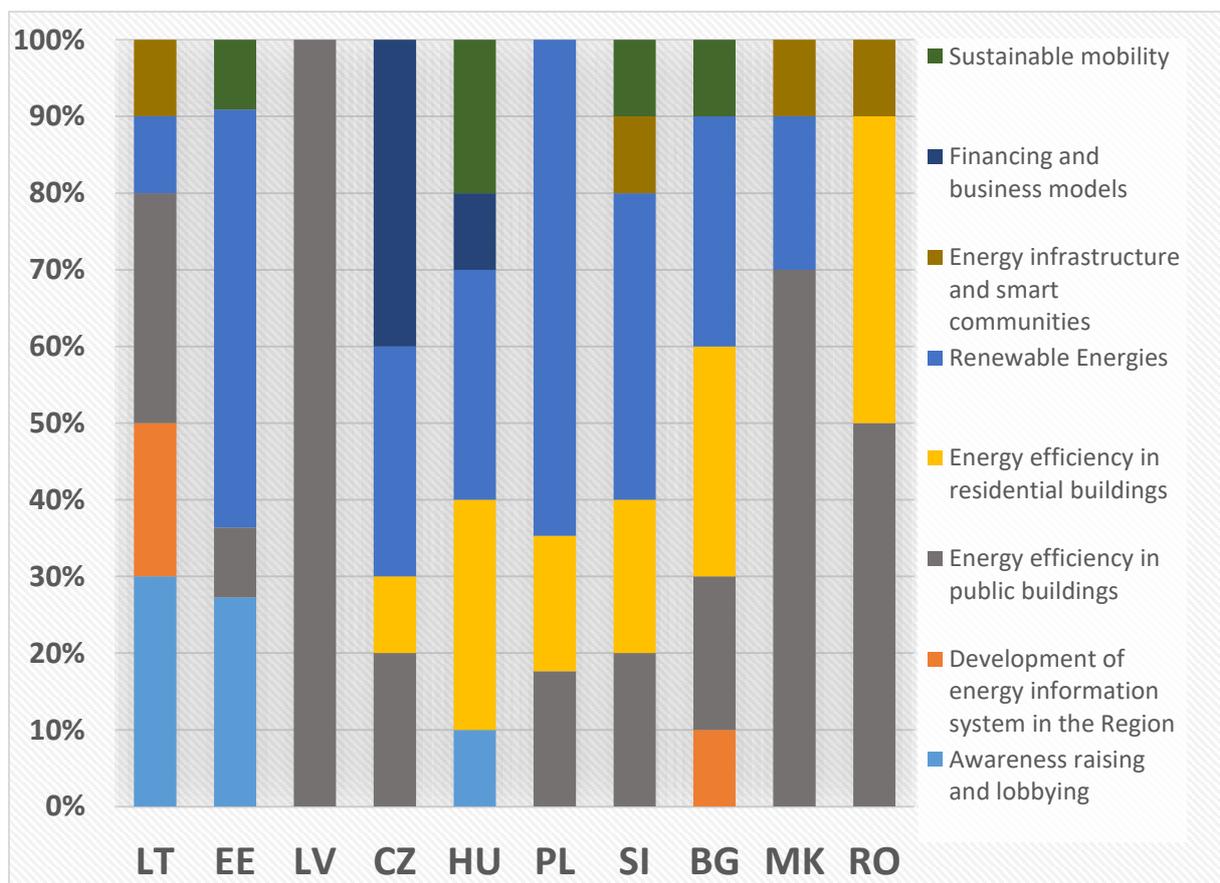

## Energy Roadmaps

Ten Roadmaps towards a sustainable low-carbon economy were developed. Nine of these roadmaps concentrate on the regional level and only the Estonian case is a national roadmap and has developed Action Plans accordingly. Since Estonia is a relatively small country with flat hierarchies between local, regional and national level, including only few decision-makers working solely for the regional level, the decision was made to focus the Roadmap on the national level.

Partners needed to set specific priorities in their roadmap. Priority areas were chosen with the capacities and outreach of the roadmapping team in mind. The resulting Action Plans were endorsed by political decision-makers and/or members of the roadmapping team, taking responsibility for the implementation.

Analysing the chosen priority areas, it is apparent that a strong focus lies on Energy efficiency in buildings as well as development of renewable energy both in the public and the private sector. Sustainable mobility, as important contribution to more efficiency and a long-term fuel shift in the transport sector, is presented as well in four countries. Three regions (CZ, HU, BG) developed dedicated measures within the topic of energy financing.

The following graphic gives a summary of the identified priority areas of the Roadmaps:

The focus on topics concerning the public sector is strongly presented in the Roadmaps. On the one hand the public sector is in all participating regions a major energy-consuming sector (buildings, infrastructure) with significant potential for improvement. On the other hand, PANEL 2050 actors, e.g. as regional energy or development agencies, are

acting through existing cooperation with municipalities, public officers and also political decision-makers on a regional level. The cooperation with the public sector was deemed essential in the roadmapping process, not only due to the involvement of decision-makers but also considering the potential of the public sector to act as role model to spark additional actions.

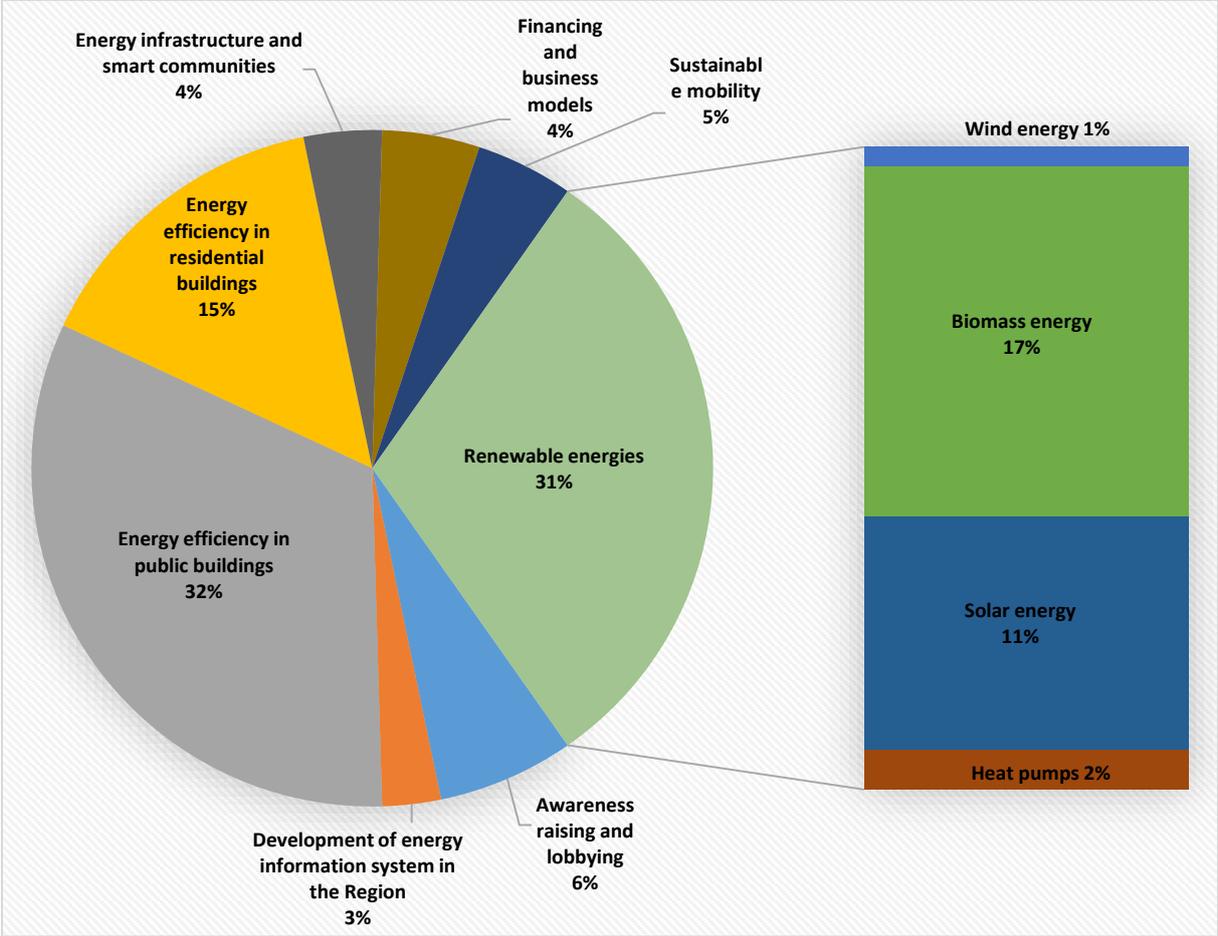

In the Roadmaps private sector engagement could be more prominent as reaching the vision will impact mostly economic sectors, and finally also require private financing means in addition to public funds. To be more specific, for example the Estonian Roadmap foresees a significant shift of the local economy from an oil-shale dominated energy industry to renewable energies. In particular, in the development of new (smart) energy technologies and electromobility, technology and R&D focussed companies will play an important part in facilitating a feasible technology shift. More awareness in the sector of private businesses and industries will be key. Good example in this field provide the Roadmap for Estonia and also Borsod-Abaúj-Zemplén and Heves counties (HU) as awareness raising and lobbying for a low-carbon economy is part of their implementation strategy.

Another example from Czech Republic on one hand shows importance of bottom-up technology initiatives (self-sufficient buildings), on the other hand reflects the current needs of a highly developed biogas sector that is now seeking its critical break point related to the termination of the operational subsidy scheme and measures towards regional financing tools for energy efficiency. An example from Lithuanian's region Ignalina is closely related to the Nuclear Power Plant decommissioning and synced to the consequences as well as the benefits of this long-term project that will affect the social, economic and environmental development of this area. Five regions (PL, RO, LV, MK and partly BG) chose to design their action plans specifically for concrete municipalities mainly in the field of energy efficiency or renewable energy.

For the overview of each Roadmap structure and priority areas focus see Annex 1 of this report and for the full details read the individual Roadmaps.

# Action Plans

As essential part of the 10 presented roadmaps in total **108 Action Plans** were developed and endorsed by implementing organisations or groups. The majority of actions concentrated either on the improvement of buildings (51 of 108) – with a clear majority focusing on the public sector – or the strengthening of renewable energy production (33 of 108). The rest of the actions either concentrated on awareness raising, the mobility sector or financing and business models.

Time frame of the Action Plans and thereby their implementation frame ranged from short term measures (up to three years) to more strategic long-term plans aiming at continuous action until reaching their targets in 2050.

It was obvious that the roadmapping team (consisting of PANEL 2050 experts and local stakeholders and implementers) strongly influenced the methodological development as well as orientation of the Action Plans. Accordingly, different approaches in determining needed actions were chosen.

The Action Plans for Latvia, Poland, Romania, Macedonia and partly Bulgaria very much concentrate on municipal level. They aim at acting on single municipal level in order to spark the transition in chosen municipalities and use them as concrete examples for the whole region to multiply the results. The timeframe of the Action Plans is on average 3 to 5 years with many activities supposed to starting right after the PANEL project termination (Q1 2019), whereby some of them already started.

A similar time frame was chosen in the collection of Action Plans developed for the Podravje region, Slovenia. All Action Plans are aimed at implementation on regional scale but follow the strategy to start on single city/municipality level with pilot projects. The experiences and results gained from the pilots will be used for the further region-wide roll-out.

For the counties of Borsod-Abaúj-Zemplén and Heves, Hungary, and Estonia different approaches were chosen. Implementation of the endorsed Action Plans are starting as well in Q1 2019, but their direction is more long-term oriented with constant monitoring, evaluation and corrective measures planned until 2050.

For the full list of Action Plans see [Annex 2](#).

## **Endorsement by implementers and decision-makers**

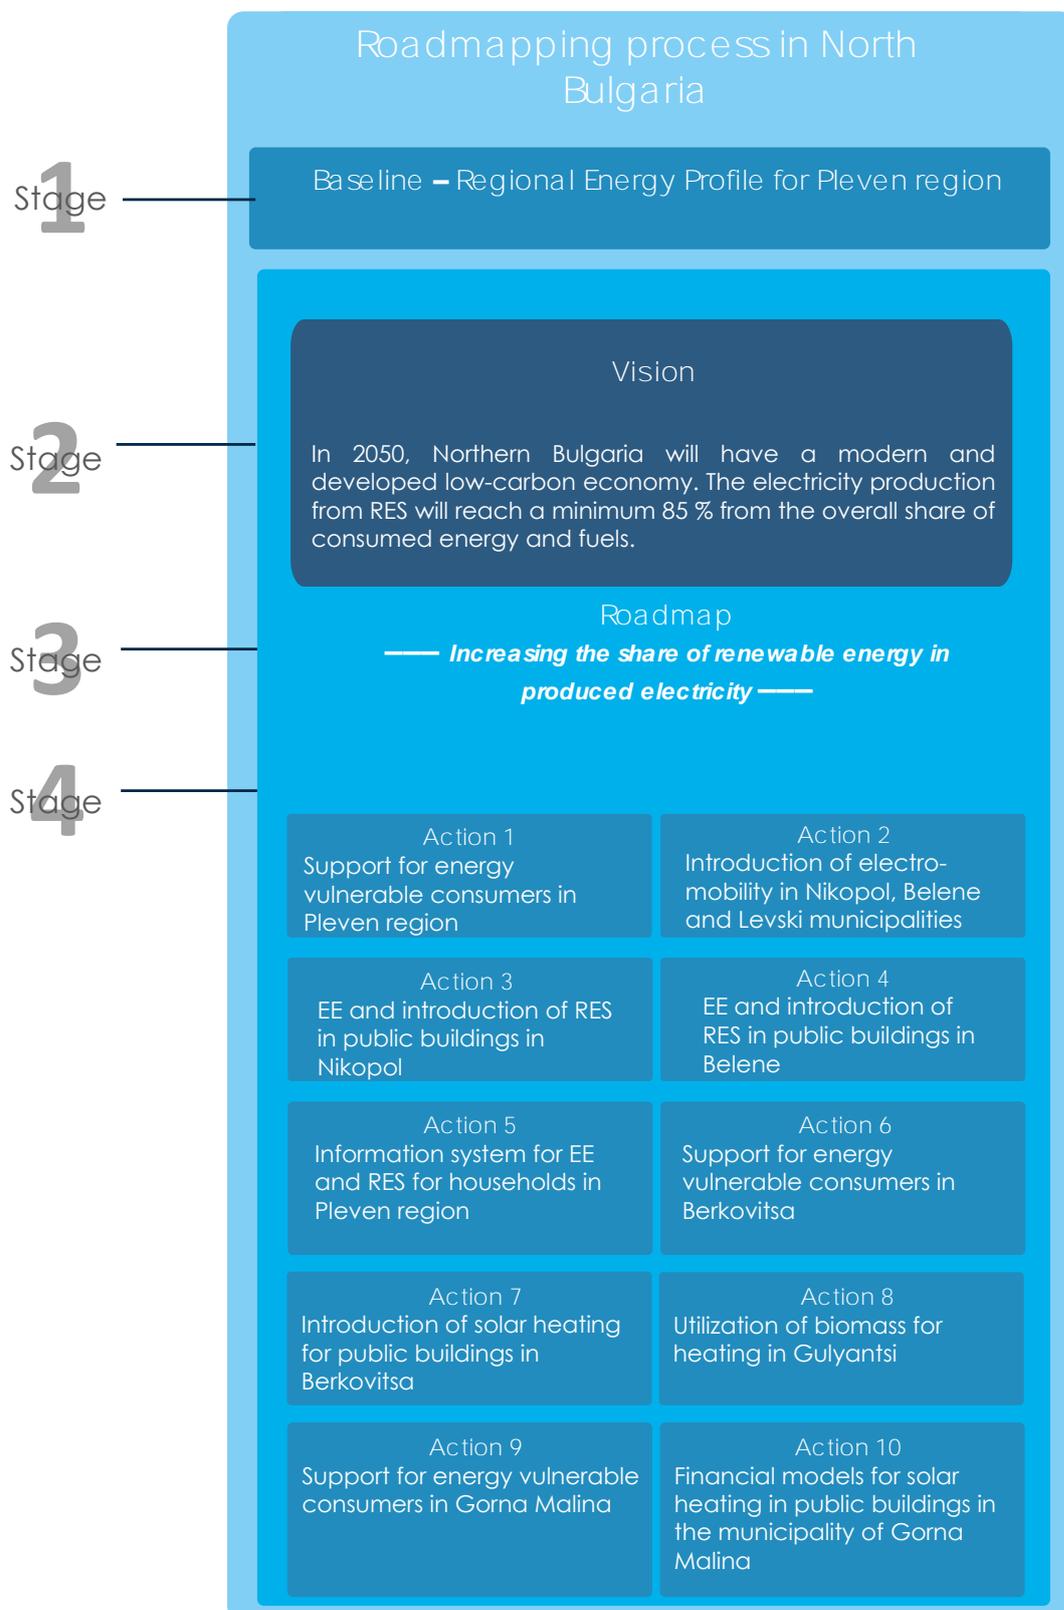

Formal endorsement of the roadmap is key to ensure the continuity and implementation of the roadmap including the Action Plans.

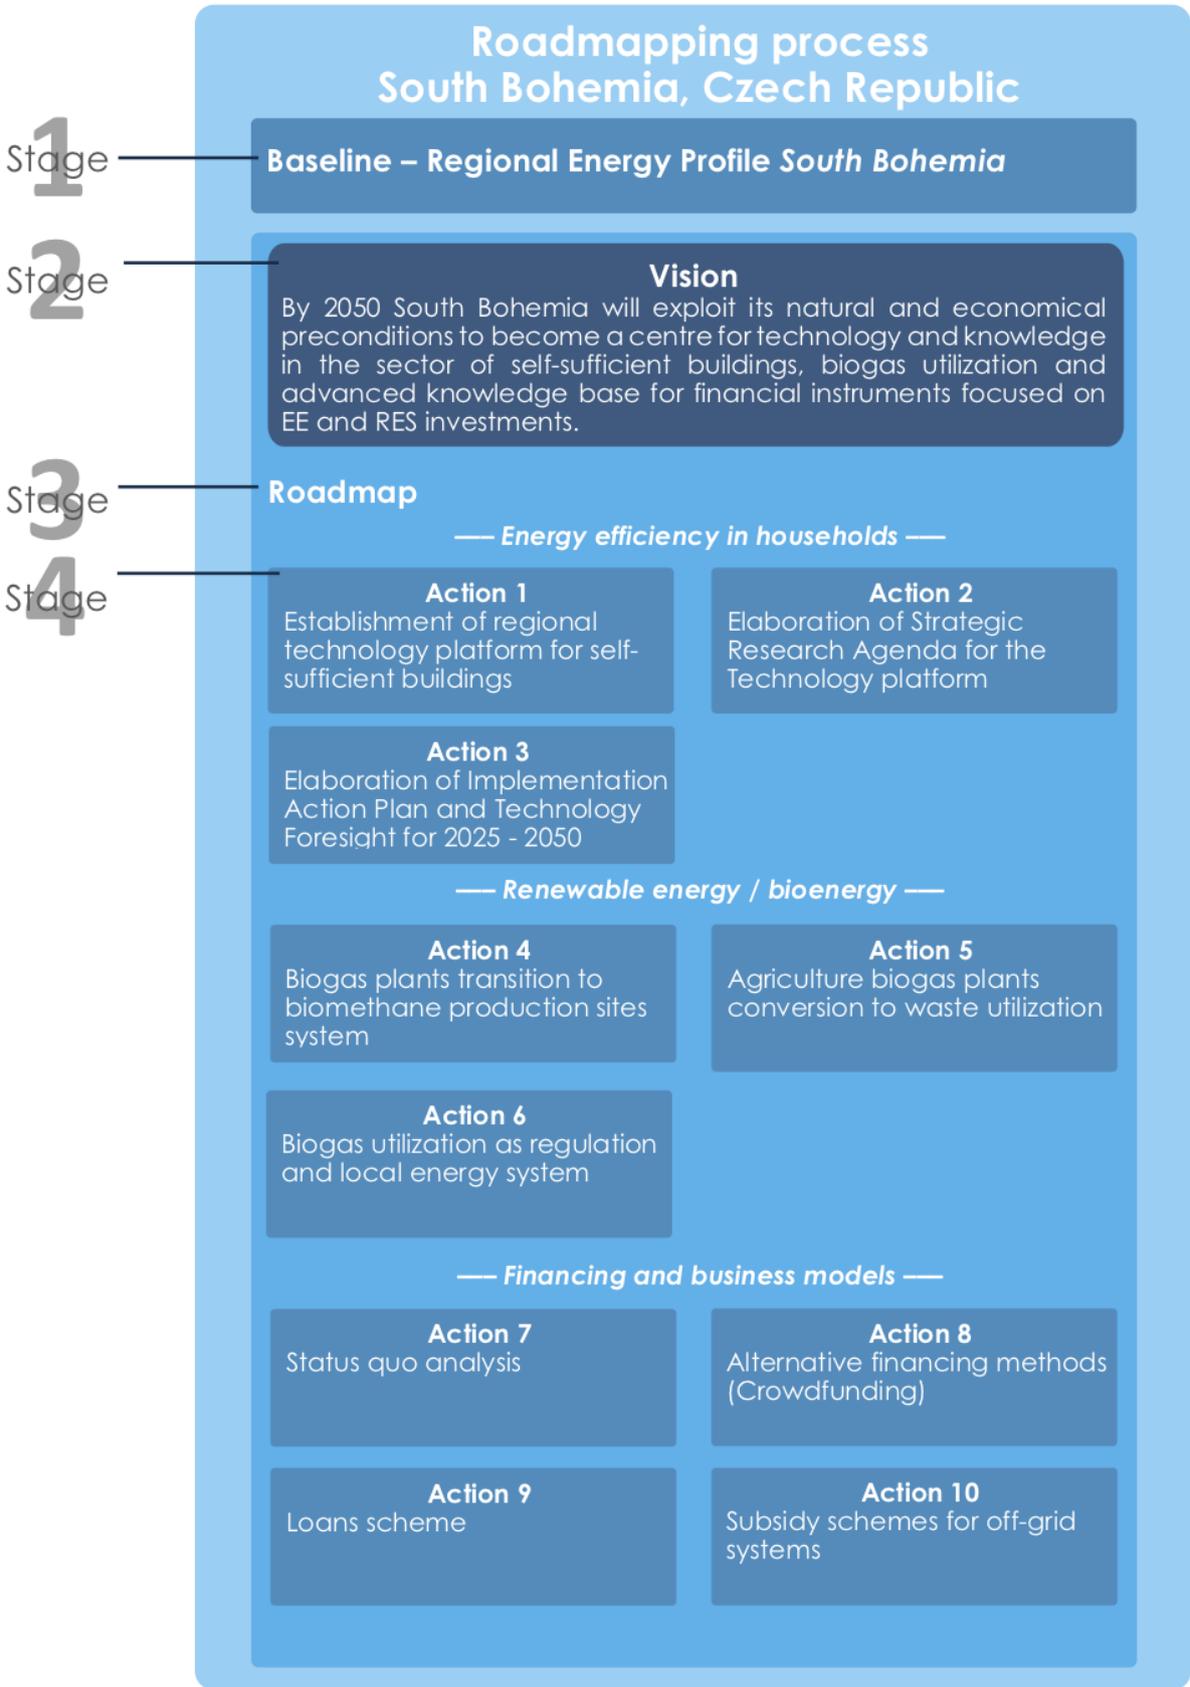

All partners have delivered formal signed letters of commitments / intents providing a commitment of their signatories towards the individual Action Plans or Roadmaps in general. In majority the confirmations were issued by municipalities or related public bodies as well as associations or directly by the implementers who act like guarantors of particular measures. In some cases, the Roadmaps/Action Plans were also recognized officially as a strategic project or approach on regional level.

List of collected commitments for Energy Roadmaps / Action Plans is [attached in Annex 3](#).

# ANNEX 1 - Summary of Roadmaps and Action Plans

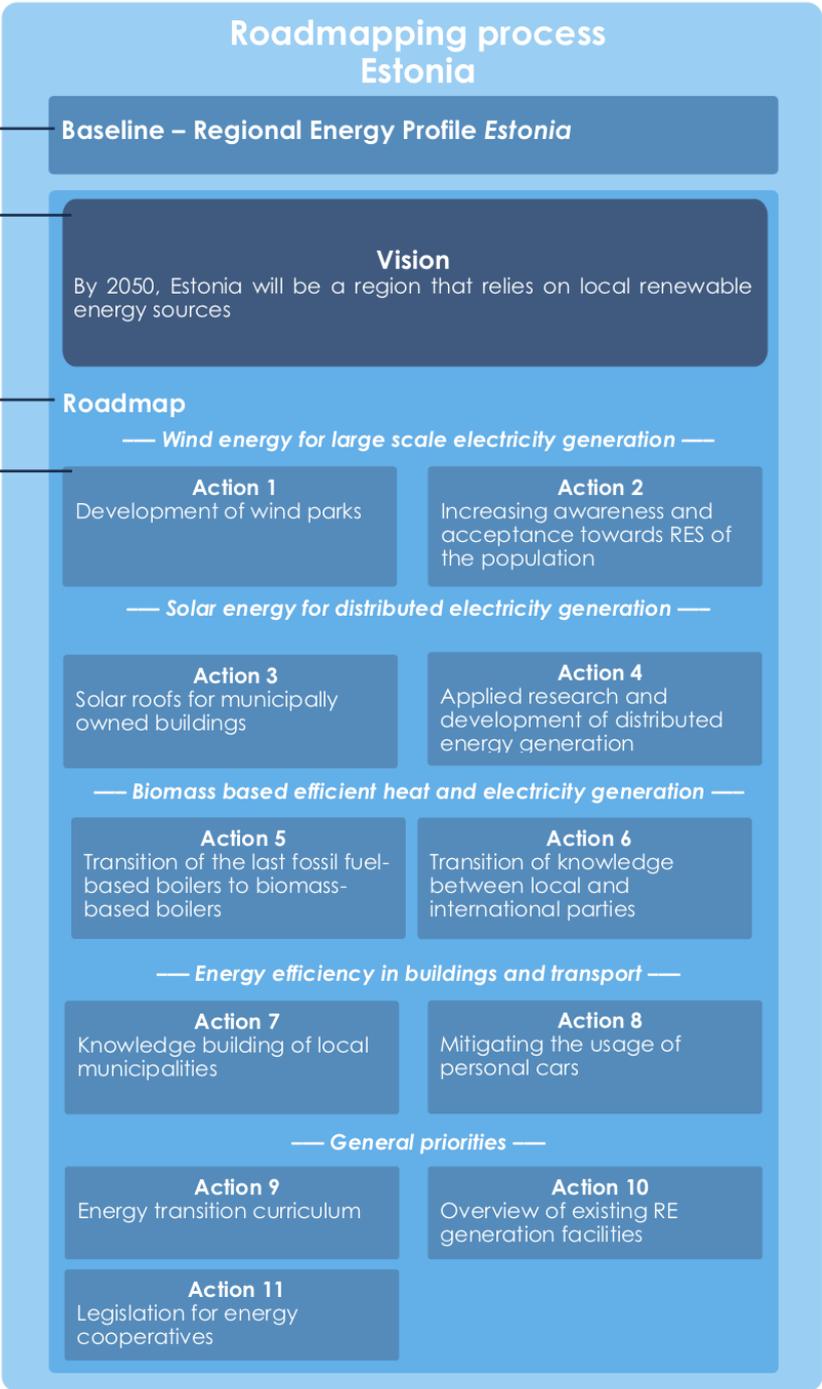

## North Bulgaria, Bulgaria

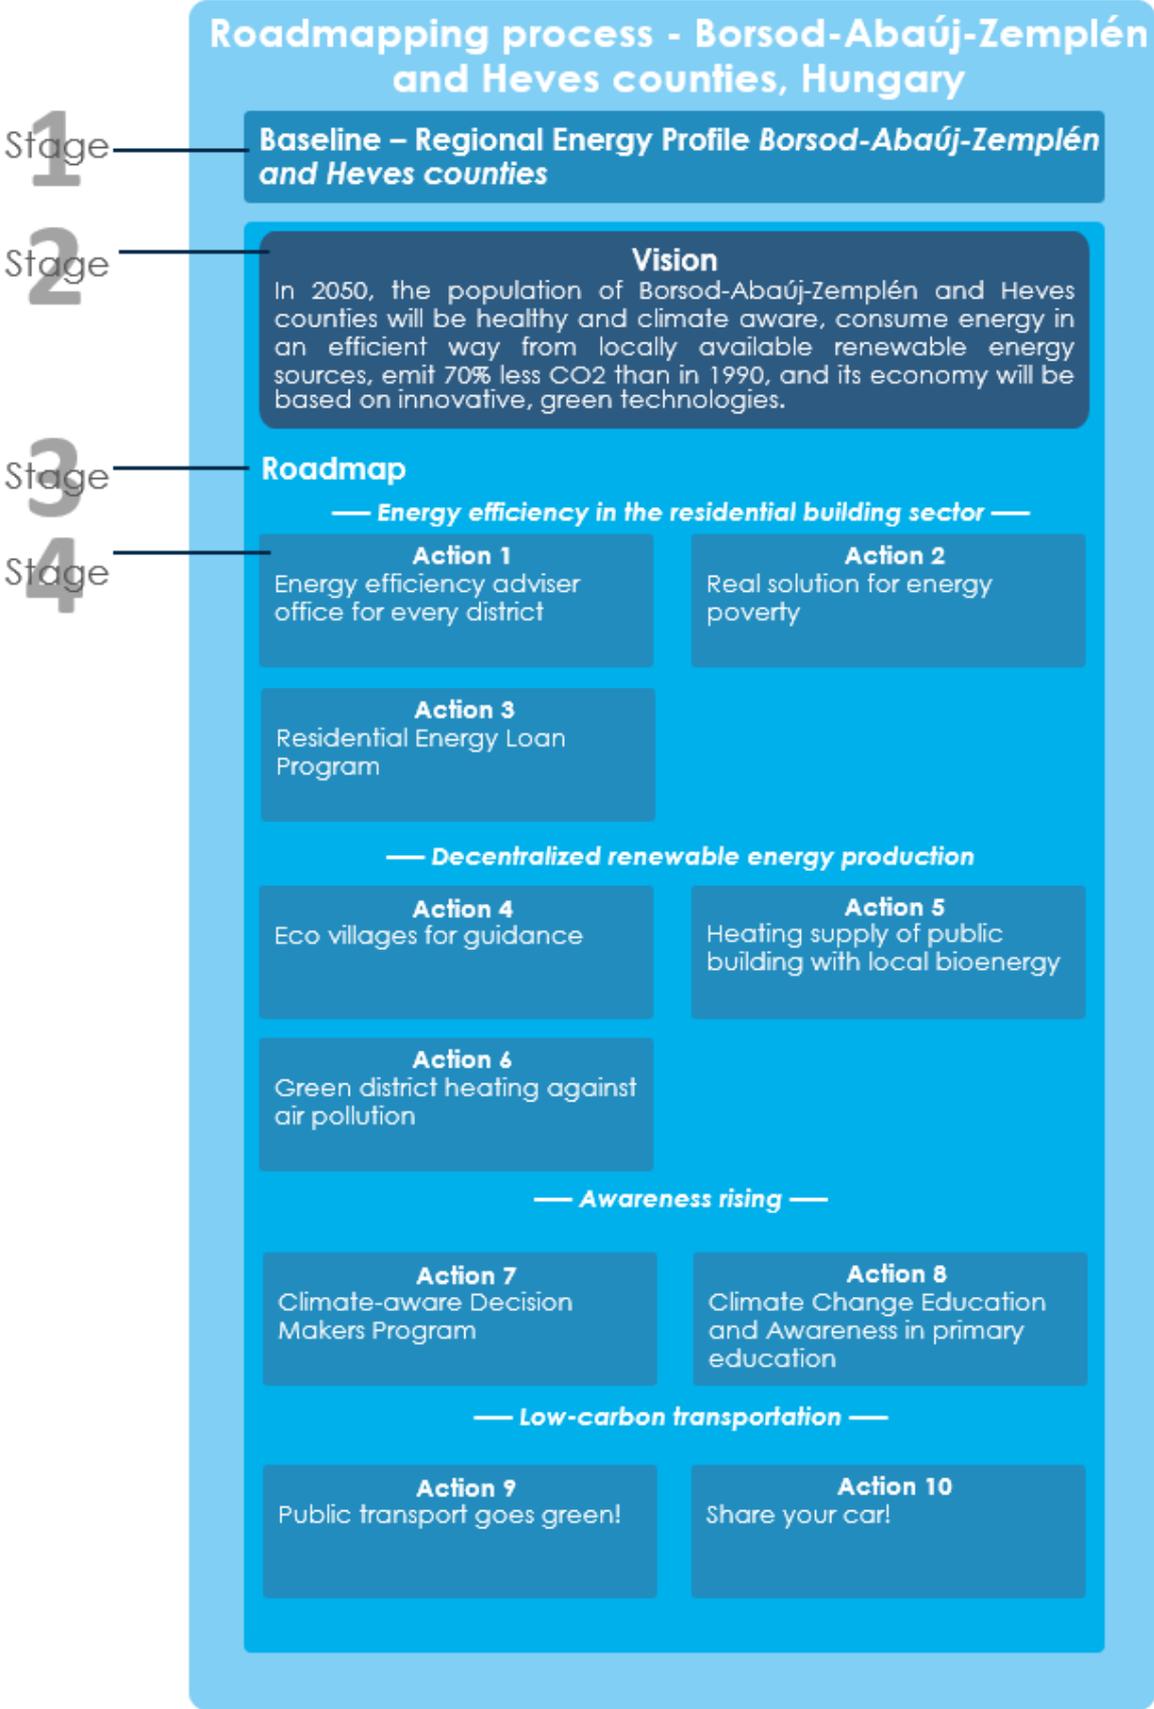

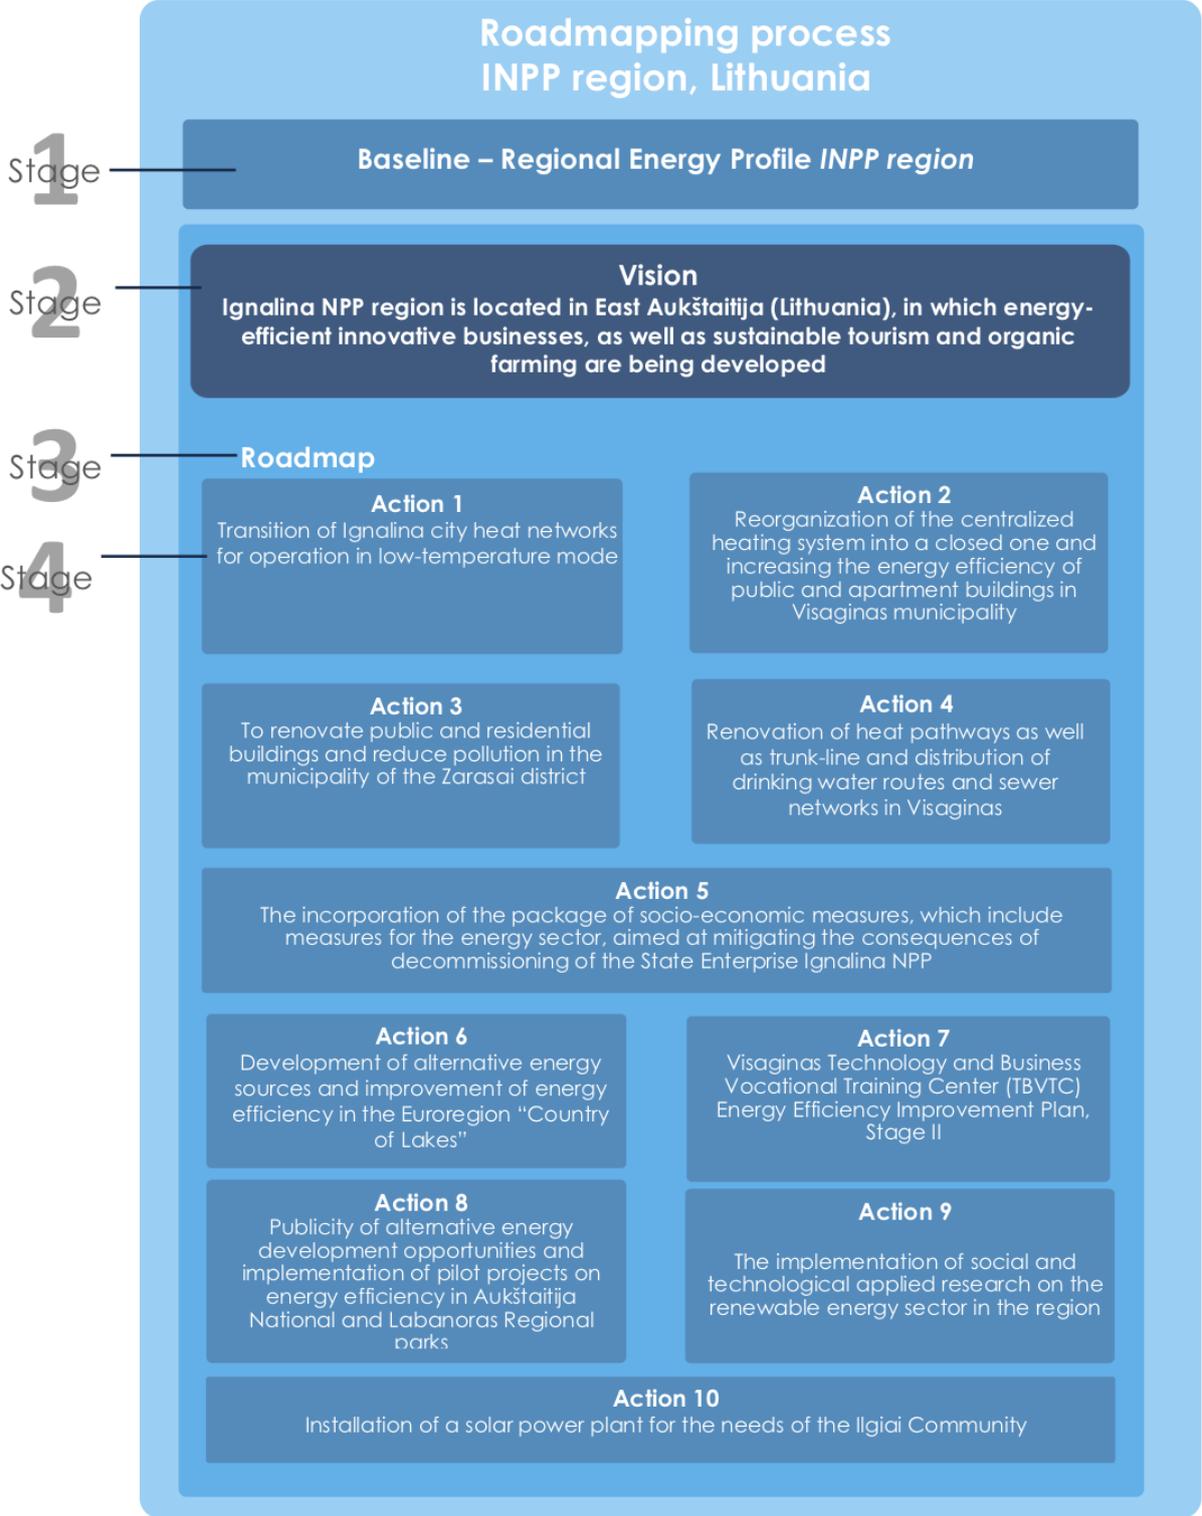

Estonia

- 1 Stage
- 2 Stage
- 3 Stage
- 4 Stage

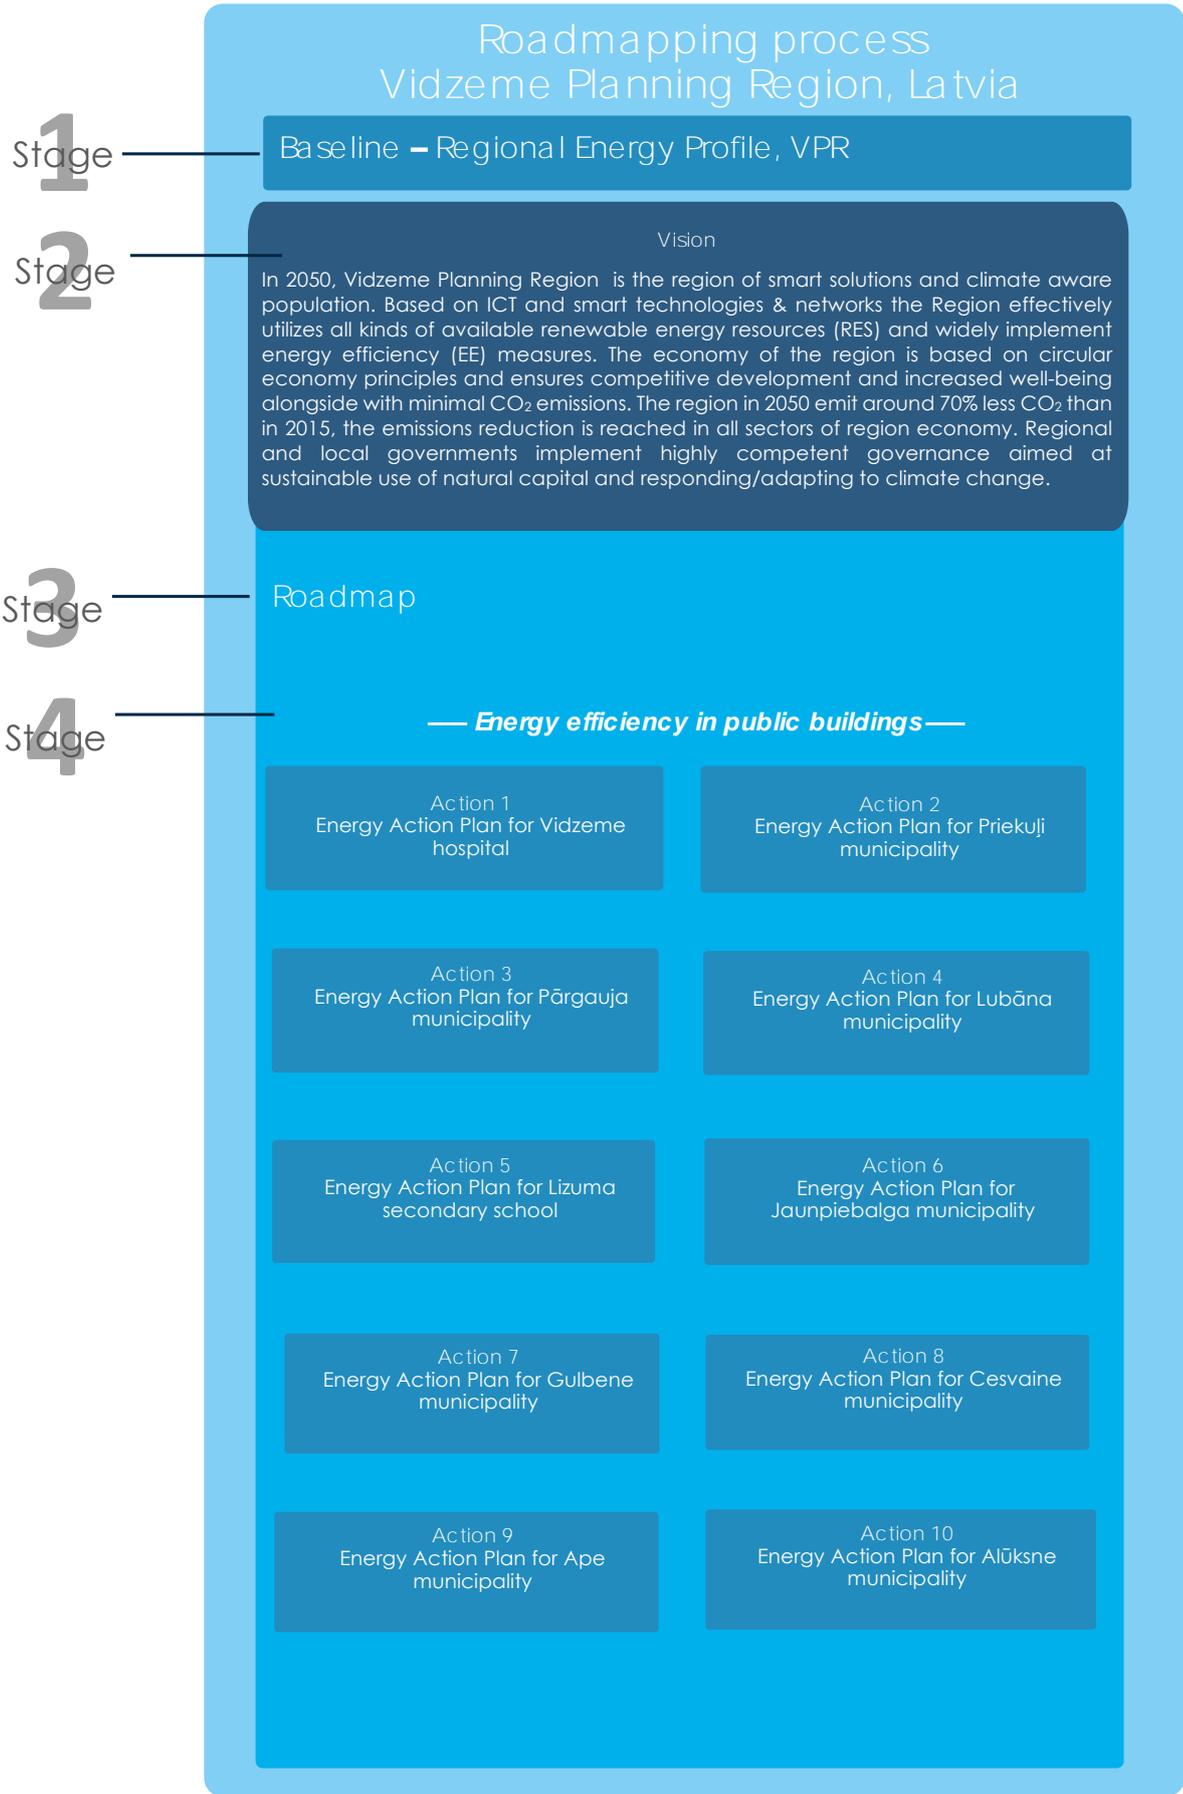

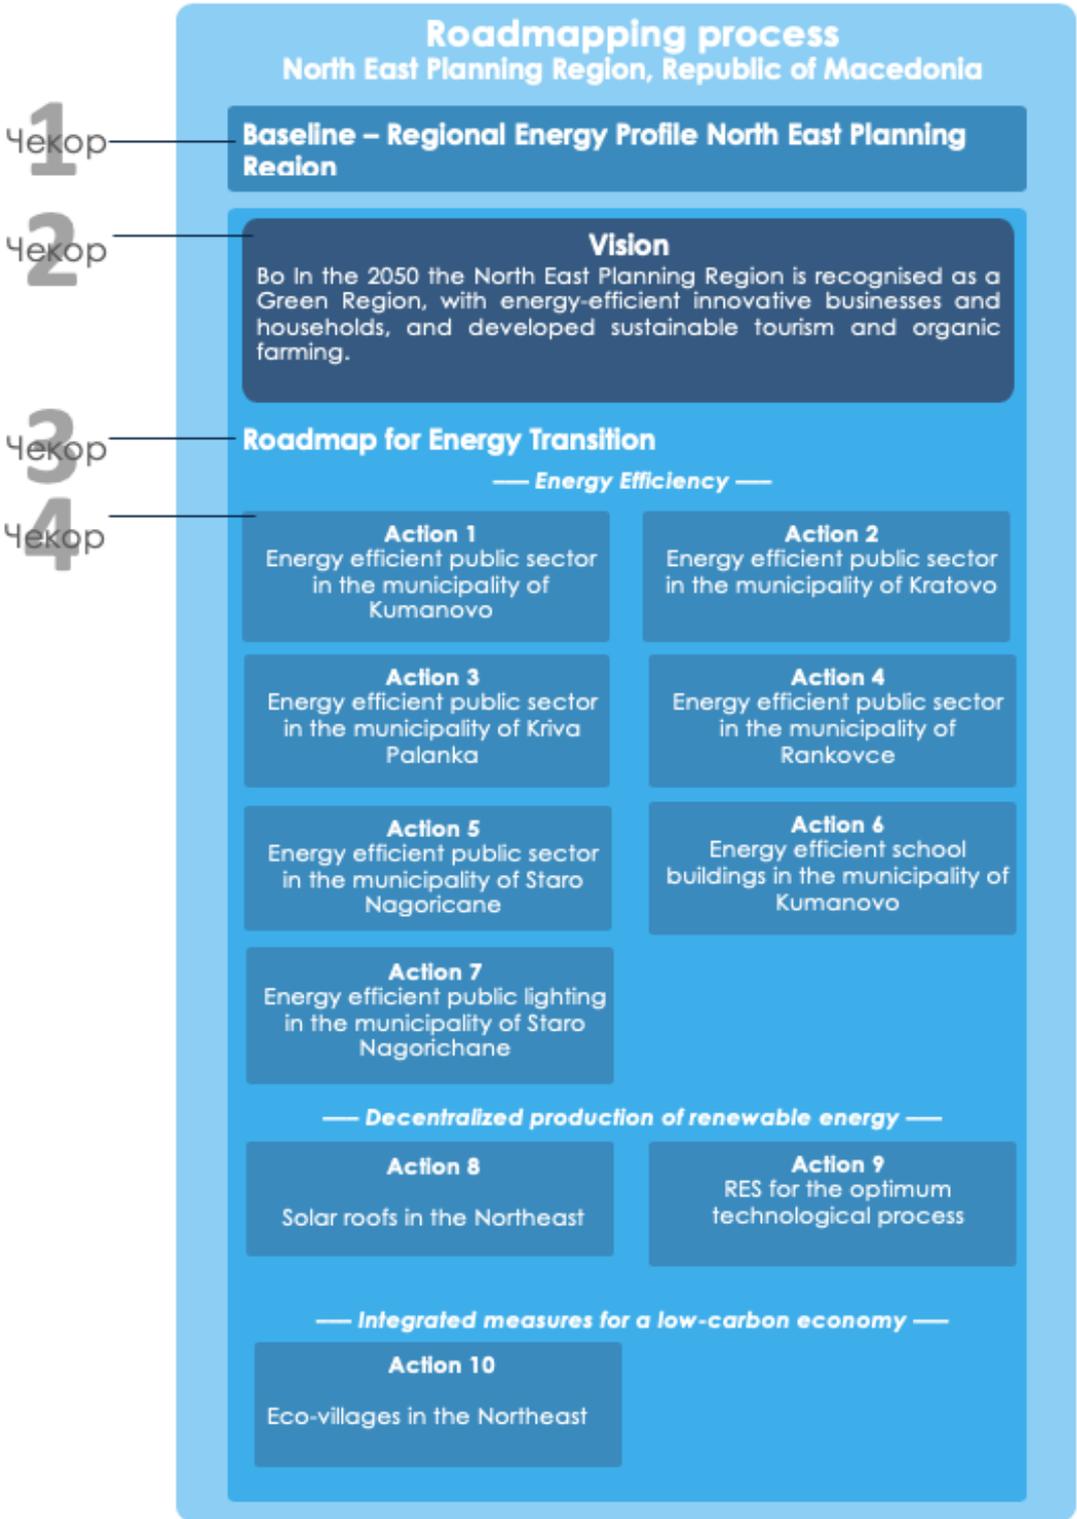

**Ignalina NPP region, Lithuania**

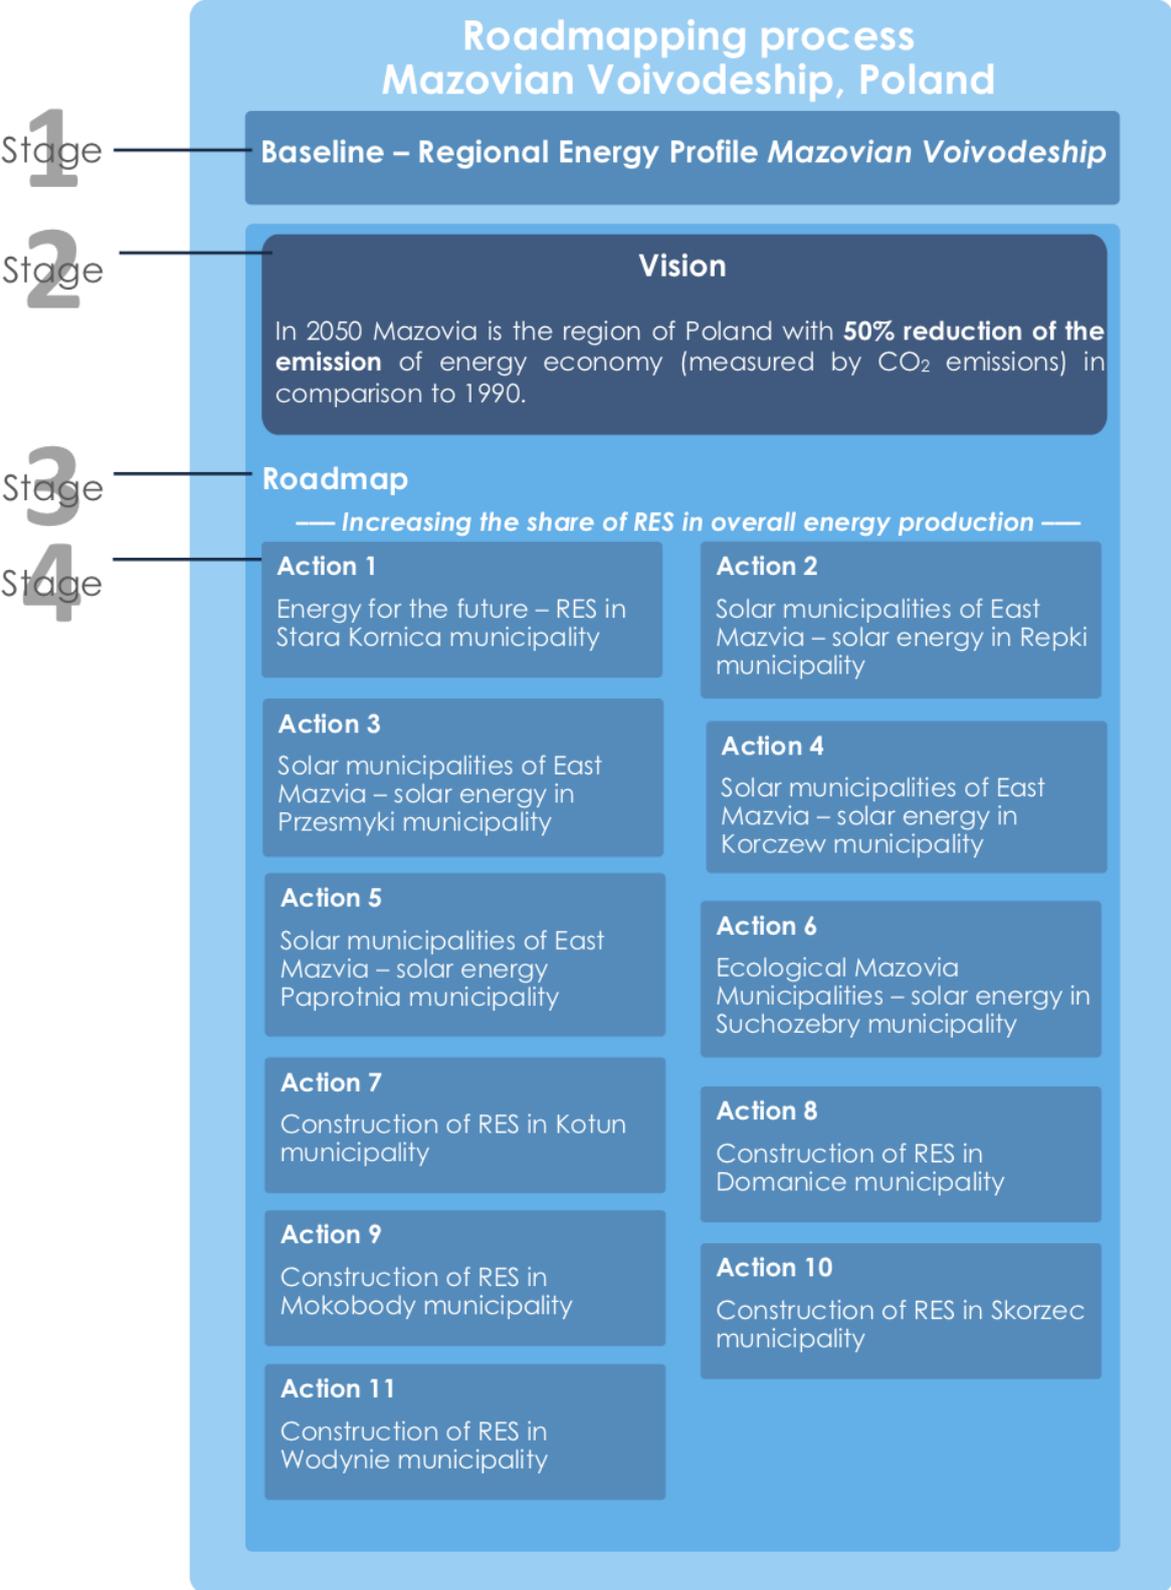

# Vidzemes planning region, Latvia

North East Planning region, Macedonia

— Increased energy efficiency in public sector —

**Action 12**

Thermomodernization of public buildings in Stara Kornica municipality

**Action 13**

Thermomodernization of public buildings in Korczew municipality

**Action 14**

Thermomodernization of public buildings in Kotun municipality

— Increased energy efficiency in housing sector —

**Action 15**

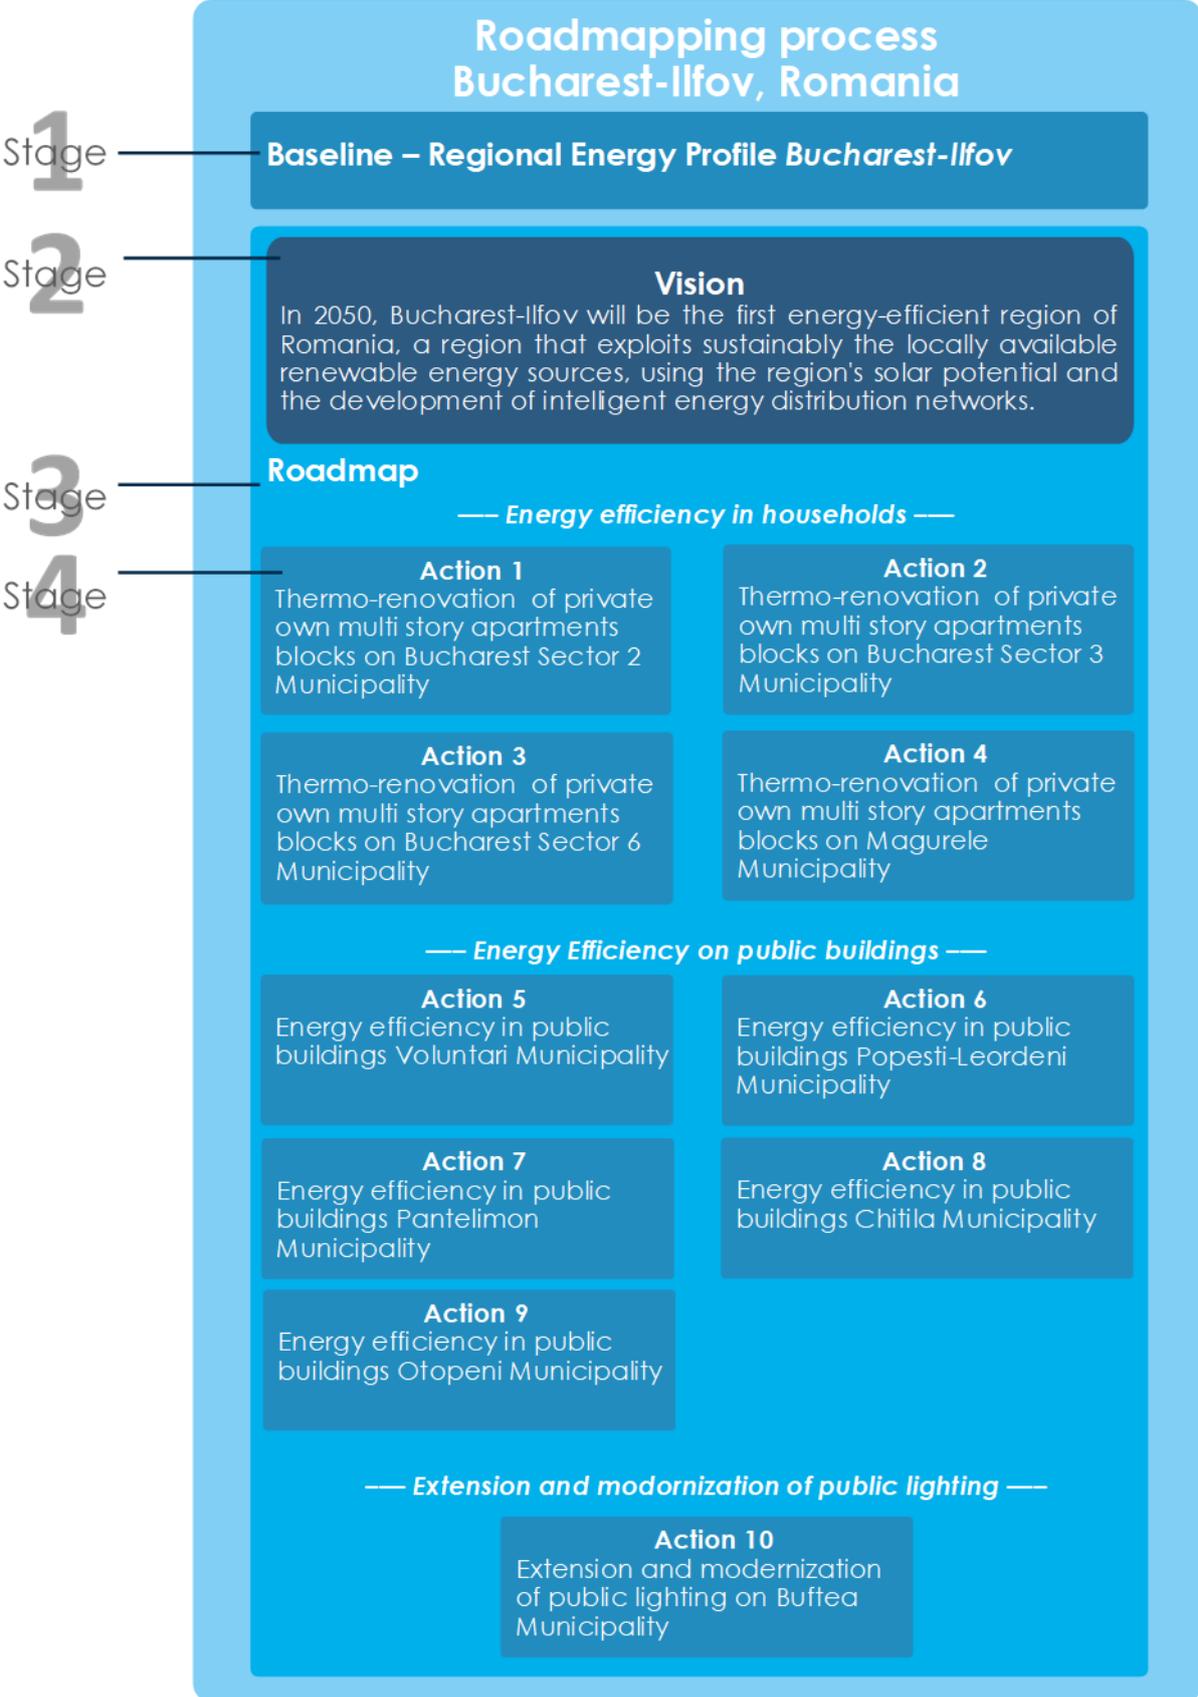

Replacement of heating devices in residential buildings in Korczew municipality

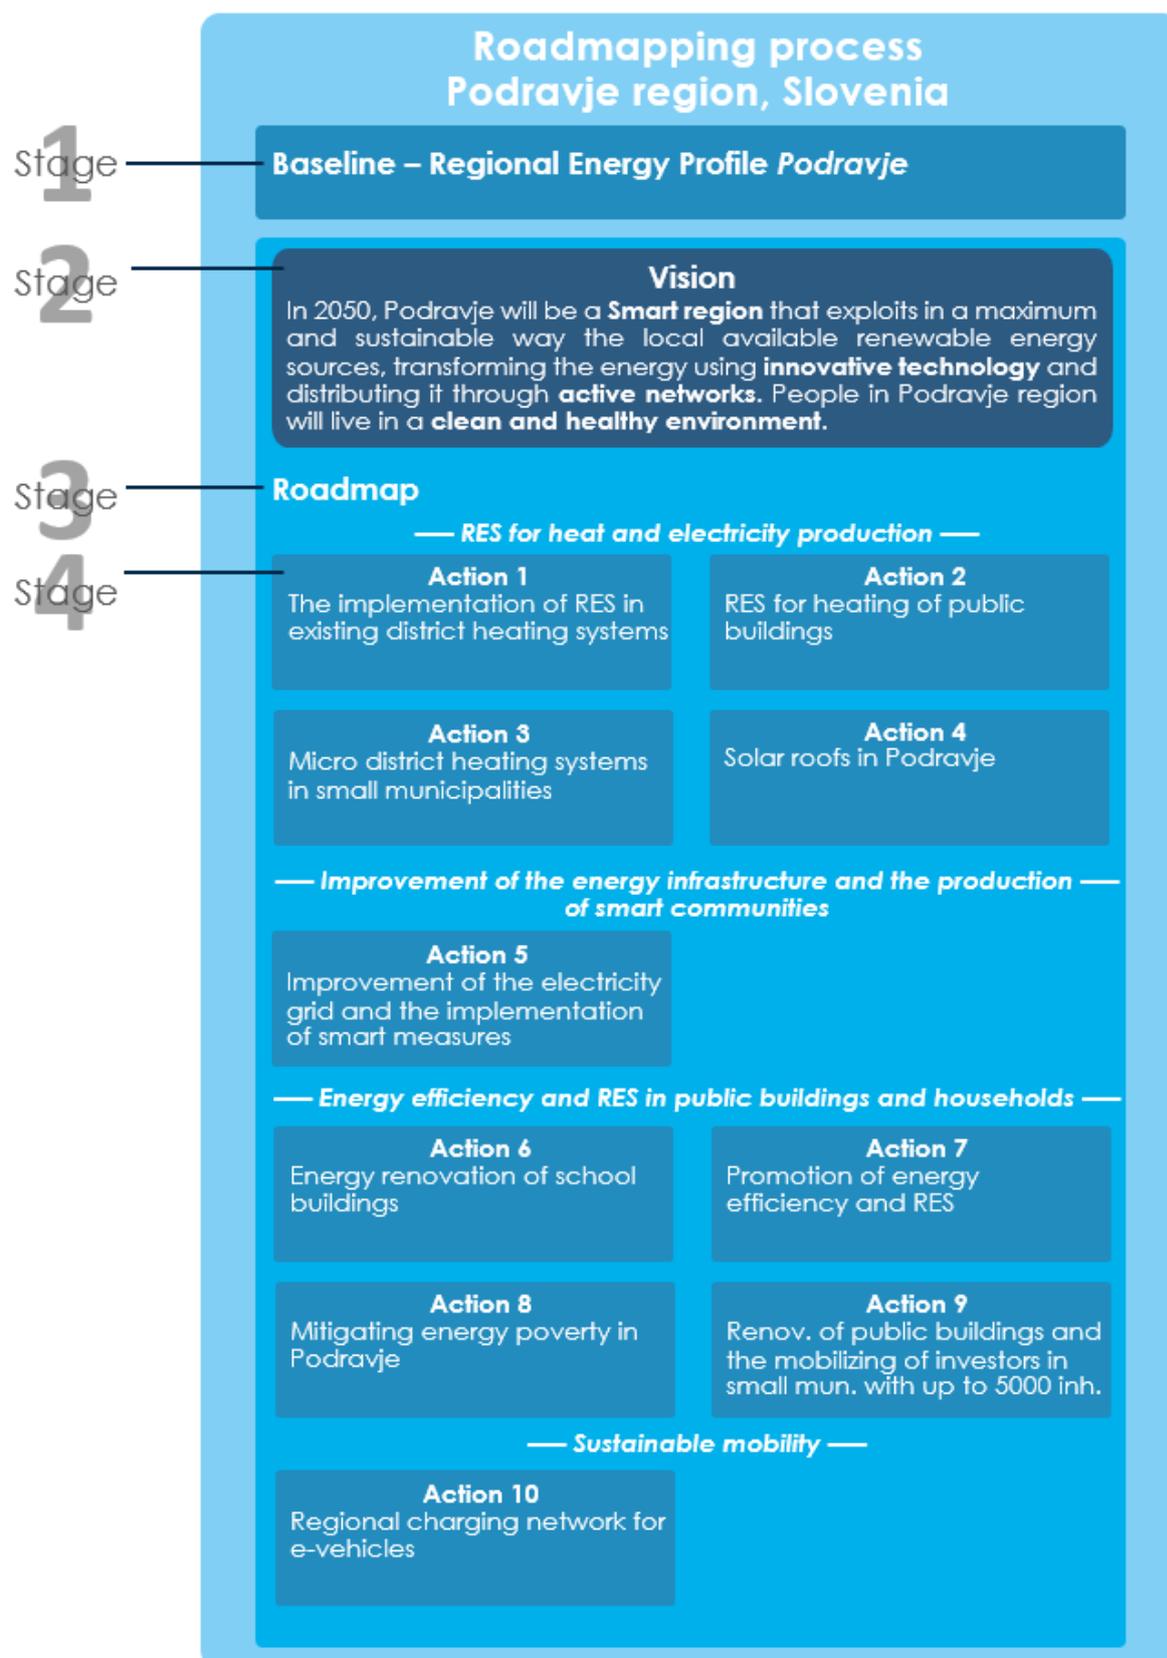

**Action 16**

Replacement of heating devices in residential buildings in Jablonna Lacki municipality

**Action 17**

Replacement of heating devices in residential buildings in Stara Kornica municipality

## ANNEX 2 - Full list of Action Plans developed

### *North Bulgaria, Bulgaria*

- Protection and support of energy vulnerable consumers in Pleven Province
- Introduction of electro-mobility and development of adequate interurban bus transport system and connections at Nikopol, Belene, Levski municipalities
- Implementing Energy Efficiency measures combined with RES installations for municipal buildings to reduce energy use in Nikopol Municipality
- Implementing Energy Efficiency measures combined with RES installations for municipal buildings to reduce energy use in Belene Municipality
- Development of an information system and awareness raising measures for the promotion of EE and RES among households in the municipalities of Pleven
- Protection and support of energy vulnerable consumers in Pleven Province
- Analysing the possibilities for building solar heating system for public buildings in the municipality of Berkovitsa
- Utilization of wetland biomass and agricultural residues as local heating source in Guliantzi Municipality
- Protection and support of energy vulnerable consumers in Gorna Malina Municipality
- Development of possible financial schemes for implementation of solar heating system in municipal buildings – Gorna Malina Municipality

### *South Bohemian region, Czech Republic*

- Establishment of regional technology platform for self-sufficient buildings
- Elaboration of Strategic Research Agenda for the Technology platform
- Elaboration of Implementation and Technology Foresight for 2025 - 2050
- Biogas plants transition to biomethane production sites system
- Agriculture biogas plants conversion to waste utilization
- Biogas utilization as regulation and local energy system
- Status quo analysis
- Alternative financing methods (Crowdfunding)
- Loans scheme
- Subsidy schemes for off-grid systems

### *Estonia*

- Development of wind parks in Estonia
- Increase of knowhow about renewable energy production among locals
- Installing Solar panels to Tallinn municipal buildings
- Research and development activities on micro- and distributed production of renewable energy
- Transfer of fossil fuel boilers to local alternative energy sources and adaptation of legislation to motivate investment and enable energy companies to enter the market.
- Developing local and international technology transfer in renewable energy
- Increasing the awareness of local governments about improving energy efficiency in public buildings (improvement of local government energy management skills)
- Reduction of private car use in the cities
- National energy transition training program
- Increasing the energy management capacity of local level administration
- Creating supportive environment for developing community energy production units

### *Borsod-Abaúj-Zemplén and Heves counties, Hungary*

- Energy efficiency in the residential building sector
- Real solution for energy poverty
- Residential Energy Loan Program
- Eco villages for guidance
- Heating supply of public building with local bioenergy
- Green district heating against air pollution
- Climate-aware Decision Makers Program
- Climate Change Education and Awareness in primary education
- Public transport goes green!
- Share your car!

### *Ignalina NPP region, Lithuania*

- Publicity of alternative energy development opportunities and implementation of pilot projects on energy efficiency in Aukštaitija National and Labanoras Regional parks
- The implementation of social and technological applied research on the renewable energy sector in the region
- Transition of Ignalina city heat networks for operation in low-temperature mode
- Installation of a solar power plant for the needs of the Ilgiai Community
- The incorporation of the package of socio-economic measures,
- Development of alternative energy sources and improvement of energy efficiency in the Euroregion "Country of Lakes"
- Reorganization of the centralized heating system into a closed one and increasing the energy efficiency of public and apartment buildings in Visaginas municipality
- Visaginas Technology and Business Vocational Training Centre Energy Efficiency Improvement Plan, Stage II
- To renovate public and residential buildings and reduce pollution in the municipality of the Zarasai district
- Renovation of heat pathways as well as trunk mains and distribution mains of drinking water and sewer networks in Visaginas municipality

### *Vidzemes planning region, Latvia*

- Alūksne County Energy
- Ape County Energy Management Pilot Plan
- Cesvaine County Energy Plan for 2018-2025
- Sustainable Energy of Gulbene County Municipal Building for 2018-2020
- Jaunpiebalga County Council Energy Management Plan for 2018 - 2022
- Lizums Secondary School Energy Action Plan
- Energy Plan for Lubāna Pre-School
- Sustainable Energy of Pārgauja County for 2018-2023
- Priekule County Energy Plan for Rūpnīcas Street 8, Liepa, Liepa Parish, Priekule County for 2018 – 2025
- Energy Management Plan of Vidzeme Hospital

### *North East Planning region, Macedonia*

- Energy Efficient Public Sector in the Municipality of Kumanovo
- Energy Efficient Public Sector in the Municipality of Kratovo
- Energy Efficient Public Sector in the Municipality of Kriva Palanka
- Energy Efficient Public Sector in the Municipality of Rankovce

- Energy Efficient Public Sector in the Municipality of Staro Nagoricane
- Energy Efficient School Buildings in the Municipality of Kumanovo
- Energy efficient street lighting in the Municipality of Staro Nagoricane
- Solar Roofs in the Northeast
- RES for optimal technological process
- Eco-villages in the Northeast

#### *Mazovian Voivodeship, Poland*

- Energy for the future - renewable energy sources in the Stara Kornica municipality
- Sunny municipalities of East Mazovia - solar energy is the energy of the future in the municipality of Repki
- Sunny municipalities of East Mazovia - solar energy is the energy of the future in the municipality of Przesmyki
- Sunny municipalities of East Mazovia - solar energy is the energy of the future in the municipality of Korczew
- Sunny municipalities of East Mazovia - solar energy is the energy of the future in the municipality of Paprotnia
- Ecological Mazovia Municipalities - friendly solar energy for humans in the Suchozobry municipality
- Construction of renewable energy installations in the Kotun municipality
- Construction of renewable energy installations in the Domanice municipality
- Construction of renewable energy installations in the Mokobody municipality
- Construction of renewable energy installations in the Skorzec municipality
- Construction of renewable energy installations in the Wodynie municipality
- Thermo-modernization of public buildings in Stara Kornica
- Thermomodernization of the Commune Office building in Korczew municipality
- Thermo-modernization of public utility buildings in the Kotuń municipality
- Replacement of heating devices In residential buildings in Korczew municipality
- Replacement of heating devices In residential buildings in Jablonna Lacki municipality
- Replacement of heating devices in residential buildings in Stara Kornica municipality

#### *Bucharest-Ilfov, Romania*

- Thermo-renovation of private own multi story apartments blocks on Bucharest Sector 2
- Thermo-renovation of private own multi story apartments blocks on Bucharest Sector 3
- Thermo-renovation of private own multi story apartments blocks on Bucharest Sector 6
- Thermo-renovation of private own multi story apartments blocks on Magurele Municipality
- Energy Efficiency in public buildings Voluntari Municipality
- Energy Efficiency in public buildings Popesti-Leordeni Municipality
- Energy Efficiency in public buildings Pantelimon Municipality
- Energy Efficiency in public buildings Chitila Municipality
- Energy Efficiency in public buildings Otopeni Municipality
- Extension and modernization of public lighting on Buftea Municipality

#### *Podravje region, Slovenia*

- The implementation of RES in existing district heating systems

- RES for heating of public buildings
- Micro district heating systems in small municipalities
- Solar roofs in Podravje
- Improvement of the electricity grid and the implementation of smart measures
- Energy renovation of School buildings
- Promotion of energy efficiency and RES
- Mitigating energy poverty in Podravje
- Renovation of public buildings and the mobilizing of investors
- Regional charging network for e-vehicles

## ANNEX 3 - List of collected commitments for the Roadmaps and Action Plans from the decision makers

Country	Title of the AP (or shortcut)	Commitment by
Hungary	Energy efficiency adviser office for every district	Borsod-Abaúj-Zemplén County Council
Hungary	Real solution for energy poverty	Borsod-Abaúj-Zemplén County Council
Hungary	Residential Energy Loan Program	Borsod-Abaúj-Zemplén County Council
Hungary	Eco villages for guidance	Borsod-Abaúj-Zemplén County Council
Hungary	Heating supply of public building with local bioenergy	Borsod-Abaúj-Zemplén County Council
Hungary	Green district heating against air pollution	Borsod-Abaúj-Zemplén County Council
Hungary	Climate-aware Decision Makers Program	Borsod-Abaúj-Zemplén County Council
Hungary	Climate Change Education and Awareness in primary education	Borsod-Abaúj-Zemplén County Council
Hungary	Public transport goes green!	Borsod-Abaúj-Zemplén County Council
Hungary	Share your car!	Borsod-Abaúj-Zemplén County Council
Estonia	Development of wind parks in Estonia	Estonian Wind Power Association
Estonia	Increase of knowhow about renewable energy production among locals	TREA
Estonia	Installing Solar panels to Tallinn municipal buildings	Tallinn Energy Agency
Estonia	Research and development activities on micro- and distributed production of renewable energy	EMU
Estonia	Greening Estonian heat sector	Estonian Biofuel Association
Estonia	Developing local and international technology transfer in renewable energy	EMU
Estonia	Increasing the awareness of local governments about improving energy efficiency in public buildings	TREA
Estonia	Reduction of private car use in the cities	Tartu city
Estonia	National energy transition training program	University of Tartu
Estonia	Increasing the energy management capacity of local level administration	EMU
Estonia	Creating supportive environment for developing community energy production units	TREA
Lithuania	Publicity of alternative energy development opportunities and implementation of pilot projects on energy efficiency in Aukštaitija National and Labanoras Regional parks	Aukštaitija National and Labanoras Regional parks
Lithuania	The implementation of social and technological applied research on the renewable energy sector in the region	Future Society Institute
Lithuania	Transition of Ignalina city heat networks for operation in low-temperature mode	Ignalina region municipality administration
Lithuania	Installation of a solar power plant for the needs of the Ilgiai Community	Ilgiai Community
Lithuania	The incorporation of the package of socio-economic measures, which include measures for the energy sector, aimed at mitigating the consequences of decommissioning of the State Enterprise Ignalina NPP in the final agreement between the Republic of Lithuania and the European Commission on the funding of the	IAERPA

	decommissioning of the State Enterprise Ignalina Nuclear Power Plant.	
Lithuania	Development of alternative energy sources and improvement of energy efficiency in the Euroregion "Country of Lakes"	Euroregion "Country of Lakes"
Lithuania	Reorganization of the centralized heating system into a closed one and increasing the energy efficiency of public and apartment buildings in Visaginas municipality	Visaginas municipality administration
Lithuania	Visaginas Technology and Business Vocational Training Centre Energy Efficiency Improvement Plan, Stage II	VTVPMC
Lithuania	To renovate public and residential buildings and reduce pollution in the municipality of the Zarasai district	Zarasai region municipality administration
Lithuania	Renovation of heat pathways as well as trunk mains and distribution mains of drinking water and sewer networks in Visaginas municipality	SE "Visagino energija"
